BIRD ID#: TBD  
ISSUE TITLE: Algorithmic Modeling API (AMI) Improvements  
REQUESTER: (in alphabetical order by company)  
Adge Hawes, IBM;  
Arpad Muranyi, Mentor Graphics;  
Walter Katz, Mike Steinberger, Todd Westerhoff, SiSoft

DATE SUBMITTED:  
Date of Draft: 11/17/2009  
DATE REVISED:  
DATE ACCEPTED BY IBIS OPEN FORUM: PENDING

\*\*\*\*\*

STATEMENT OF THE ISSUE:

Based on the experiences of several EDA vendor and IC vendor implementations of AMI models and EDA software using AMI models it has become apparent that a number of changes to the document are required to correct the reference flow, clarify the specification and simplify both the development of AMI models and EDA software using AMI models.

Existing known AMI models and .ami files will work with these changes.

Section 6c and 10 are to be replaced with the following.

Summary of significant changes

**Change Reference Flows**

Remove Branches  
Reserverd\_Parameters  
Model\_Specific

Remove Reserved Parameters  
Tx\_Jitter  
Rx\_Clock\_PDF

Add Reserved Parameters

Support Environment Variables

Section 6c

A L G O R I T H M I C M O D E L A P I S U P P O R T

INTRODUCTION:

Executable shared library files to model advanced Serializer-Deserializer (SERDES) devices are supported by IBIS. This chapter describes how executable models written for these devices can be referenced and used by IBIS files.

The shared objects use the following keywords within the IBIS framework:

```
[Algorithmic Model]
[End Algorithmic Model]
```

The placement of these keywords within the hierarchy of IBIS is shown in the following diagram:

Figure 1: Partial keyword hierarchy

GENERAL ASSUMPTIONS:

This proposal breaks SERDES device modeling into two parts - electrical and algorithmic. The combination of the transmitter's analog back-end, the serial channel and the receiver's analog front-end are assumed to be linear and time invariant. There is no limitation that the equalization has to be linear and time invariant. The "analog" portion of the channel is characterized by means of an impulse response leveraging the pre-existing IBIS standard for device models.

The transmitter equalization, receiver equalization and clock recovery circuits are assumed to have a high-impedance (electrically isolated) connection to the analog portion of the channel. This makes it possible to model these circuits based on a characterization of the analog channel. The behavior of these circuits is modeled algorithmically through the use

of executable code provided by the SERDES vendor. This proposal defines the functions of the executable models, the methods for passing data to and from these executable models and how the executable models are called from the EDA platform.

The parameter definition file (.ami) is an ASCII file that contains AMI-Parameters that are used to:

- Specify flows that the model supports.
- Configures the model for specific silicon implementations.
- Configures the model for specific model programming.
- Tells the EDA tool how to analyze the model output.
- Tells the EDA tool what parameters are returned from the model.

AMI-Parameters can either be Reserved Parameters or Model Specific Parameter.

AMI-Parameters are passed into the model and returned from the model using a parameter tree syntax. The .ami file is in essentially the same format as the string passed into and returned from the model except that in place of the parameter value, the .ami file contains sub-parameters that describe the Type, Usage, Allowed Values, and Description of the parameter.

The parameter tree contains a root, branches and leaves. Only leaves may have sub-parameters, except that the root and branches may have the sub-parameter Description.

#### DEFINITIONS:

The root and branch names are case sensitive, and must start with a letter [a-Z], and may contain letters [a-Z], numbers [0-9], and underscore [\_].

Parameters are case sensitive, and must start with a letter [a-Z], and may contain letters [a-Z], numbers [0-9], and underscore [\_], except tap parameter leaves which must be a positive or negative integer. Reserved parameters will always be a leaf off the root and start with a capital letter [A-Z]. It is highly recommended that two parameters should not differ by case alone.

If a parameter has more than one sub-parameter, the order of the sub-parameters is unimportant.

The following sub-parameters are not allowed parameter names.

- Type
- Usage
- Description

The following sub-parameters describe the permitted parameter values and are not allowed parameter names.

- Value
- Range
- List
- Labels
- Corner
- Increment
- Steps
- Default

The following sub-parameters describe how the EDA tool needs to adjust tap parameters and are not allowed parameter names.

Scale  
Limit

The following sub-parameter direct the EDA tool needs to pass the values of leaves of a branch as a single string of concatenated leaf values and are not allowed parameter names.

Array

#### Environmental Variables

Parameters may reference a file name. These parameters must be of type String. If the string begins with a "\$", then the string between the \$ and the first / in the string shall be a computer system environmental parameter that must be defined by the EDA tool. A special environmental variable AMISearchPath shall contain a list of directories that the EDA tool shall search sequentially to find the file.

#### Sub-Parameter Definitions

##### Usage: (Required)

In Parameter is required Input to executable  
Out Parameter is Output only from executable  
Info Information for user or EDA platform  
InOut Required Input to executable. Executable may return a different value.

##### Type: (Required)

###### Float

Can be specified as an integer, decimal number, or in exponential format.

###### Integer

Can be positive, negative or zero.

###### String

Strings begin and end with a double quote (") and no double quotes are allowed inside the string literals. The \"s are optional if the string does not contain white space, \"(\", \" )\", \"'\" or \",\". A blank string is denoted by \" \". Adjacent double quotes are not allowed, double quotes need to have at least one character or white space between them. Carriage Return <CR> and Line Feed <LF> are explicitly allowed. There shall be no limit on the length of a String, or the number of lines in a String. If a string references a file name, then the Unix \"/\" shall delineate folders on all platforms including Windows.

###### Boolean

Values allowed are True and False.

###### Tap

The leaves of a branch represent Tx or Rx equalization coefficients.  
Values shall be Float

###### UI

Unit Interval, 1 UI is the inverse of the data rate frequency,  
for example 1 UI of a channel operating at 10 Gb/s is 100ps)

Value: <value> Single value data  
<value>=NA implies there is no constraint on the <value>  
Example (Value 5.)

Range: <typ> <min> <max>  
<typ> >= <min>  
<typ> <= <max>  
<min> = NA means there is no lower limit to a value  
<max> = NA means there is no upper limit to a value  
Example (Range -1. -2. 4.)

List: <value1> <value2> <value3> ... <valueN>

Example (List Xslow Slow Typ Fast Xfast)

Labels: <label1> < label2> < label3> ... < labelN>  
 Only allowed (and optional) when a parameter has a List sub-parameter  
 Example (List Xslow Slow Typ Fast Xfast)  
 (Lables "Extremely Slow Process" "Slow Process"  
 "Typcial Process" "Fast Process" "Extremely Fast Process")

Corner: <typ value> <slow value> <fast value>  
 Example (Process 0 -1 1)

Increment: <typ> <min> <max> <delta>  
 <typ> >= <min>  
 <typ> <= <max>  
 <min> = NA means there is no lower limit to a value  
 <max> = NA means there is no upper limit to a value  
 The allowed values of the parameter are  
 typ+N\*delta where N is any positive or negative integer  
 value such that: min <= typ + N\*delta <= max  
 Example (Increment 50 NA 100 5)

Steps: <typ> <min> <max> <# steps>  
 <typ> >= <min>  
 <typ> <= <max>  
 Treat exactly like Increment with  
 <delta> == (<max>-<min>)/<# steps>  
 Example (Steps 50 0 100 20)

Default <value>: (Optional)  
 Depending on the Type, <value> will provide a default value for the  
 parameter. For example, if the Type is Boolean, <value> could be True  
 or False, if the Type is Integer, the <value> can be an integer value.  
 Default is not allowed if Allowed-Value is Value, or Corner.  
 If Default is not specified, then the default value of a parameter shall depend  
 on the Allowed-Value. If Default is specified then it must be a legal Allowed-Value.

Value: NA  
 Range: <typ>  
 List: <value1>  
 Label: NA  
 Corner: NA  
 Increment: <typ>  
 Steps: <typ>

Description <string>: (Required for Model Specific Parameters)  
 ASCII string following Description describes a reserved parameter,  
 model specific parameter, a branch within the parameter tree  
 or the Algorithmic model itself. It is used  
 by the model make to convey information to the [EDA platform](#) and for the EDA platform  
 to convey information to the end-user.  
 There shall be no limit on the length of a Description, or the number of lines  
 in a Description, however, the model developer should assume that the first  
 128 characters of the first line be at minimum an abstract of the full description.  
 The location of Description will determine what the parameter, branch or model  
 is being described.

Every parameter must have one, and only one of the following "Allowed-Value" sub-parameters:

- Value
- Range
- List
- Corner
- Increment
- Steps

Note that in the context of Algorithmic Model for type 'Corner', <slow value> and <fast value> align implicitly to slow and fast corners, and <slow value> does not have to be less than <fast value>. For type 'Range' and 'Increment', <min value>, <max value> does not imply slow and fast corners.

If a Reserved Parameter must have one and only one Usage, Usage is optional.  
If a Reserved Parameter must have one and only one Type, Type is optional.

Notes:

1. Throughout the section, text strings inside the symbols "<" and ">" should be considered to be supplied or substituted by the model maker. Text strings inside "<" and ">" are not reserved and can be replaced.
2. Throughout the document, terms "long", "double" etc. are used to indicate the data types in the C programming language as published in ISO/IEC 9899-1999.
3. Throughout the section, text strings inside the symbols "[(" and ")]" indicate that the parameter definition is optional.
4. Previous versions of the AMI spec used the two-word keyword sequence Format along with the Allowed-Value keyword. These AMI files can be corrected for the new format by simply removing the keyword Format from the AMI file. No change to the DLL is required. These AMI files can be parsed for the new format by simply ignoring the keyword Format from the AMI file.
5. Previous versions of the AMI spec required all parameter be either in a Reserved Parameter branch, or a Model Specific branch. These AMI files can be corrected for the new format by simply removing the Reserved Parameter branch and Model Specific branch from the AMI file, thus moving all parameter definition to the root branch of the parameter tree. No change to the DLL is required. These AMI files can be parsed for the new format by simply moving all parameters in the the Reserved Parameter branch and Model Specific branch into the root branch of the tree.

=====

KEYWORD DEFINITIONS:

=====

Keywords: [Algorithmic Model], [End Algorithmic Model]  
Required: No

Description: Used to reference an external compiled model. This compiled model encapsulates signal processing functions. In the case of a receiver it may additionally include clock and data recovery functions. The compiled model can receive and modify waveforms with the analog channel, where the analog channel consists of the transmitter output stage, the transmission channel itself and the receiver input stage. This data exchange is implemented through a set of software functions.

The signature of these functions is elaborated in section 10 of this document. The function interface must comply with ANSI 'C' language.

Sub-Params: Executable

Usage Rules: The [Algorithmic Model] keyword must be positioned within a [Model] section and it may appear only once for each [Model] keyword in a .ibs file. It is not permitted under the [Submodel] keyword.

The [Algorithmic Model] always processes a single waveform regardless whether the model is single ended or differential. When the model is differential the waveform passed to the [Algorithmic Model] must be a difference waveform.

[Algorithmic Model], [End Algorithmic Model]  
Begins and ends an Algorithmic Model section, respectively.

Subparameter Definitions:

Executable:

Three entries follow the Executable subparameter on each line:

```
Platform_Compiler_Bits File_Name Parameter_File
```

The Platform\_Compiler\_Bits entry provides the name of the operating system, compiler and its version and the number of bits the shared object library is compiled for. It is a string without white spaces, consisting of three fields separated by an underscore '\_'. The first field consists of the name of the operating system followed optionally by its version. The second field consists of the name of the compiler followed by optionally by its version. The third field is an integer indicating the platform architecture. If the version for either the operating system or the compiler contains an underscore, it must be converted to a hyphen '-'. This is so that an underscore is only present as a separation character in the entry.

The architecture entry can be either "32" or "64". Examples of Platform\_Compiler\_Bits:

```
Linux_gcc3.2.3_32  
Solaris5.10_gcc4.1.1_64  
Solaris_cc5.7_32  
Windows_VisualStudio7.1.3088_32  
HP-UX_accA.03.52_32
```

The EDA tool will check for the compiler information and verify if the shared object library is compatible with the operating system and platform.

Multiple occurrences, without duplication, of Executable are permitted to allow for providing shared object libraries for as many combinations of operating system platforms and

compilers for the same algorithmic model.

The File\_Name provides the name of the shared library file. The shared object library can be in the same directory as the IBIS (.ibs) file, or in directories defined in an environmental variable AMISearchPath.

The Parameter\_File entry provides the name of the parameter file with an extension of .ami. This must be an external file and should reside in the same directory as the .ibs file and the shared object library file. It will consist of reserved and model specific (user defined) parameters for use by the EDA tool and for passing parameter values to the model. If there are multiple Executable lines in a [Algorithmic Model] they all must have the same Parameter File entry.

The model parameter file must be organized in the parameter tree format as discussed in section 3.1.2.6 of "NOTES ON ALGORITHMIC MODELING INTERFACE AND PROGRAMMING GUIDE", Section 10 of this document.

The Model Parameter File must be organized in the following way:

```
(<my_AMIname>          | Name given to the Parameter file
                       | (This need not be the same as the basename
                       | of the .ami file)

    (Parameter Text))
...

(Description <string>) | description of the model
                       | (optional)
)                       | End my_AMIname parameter file
```

Reserved Parameters:

AMI_Version	(Required)
Init_Returns_Impulse	(Required)
GetWave_Exists	(Required)
Max_Init_Aggressors	(Optional)
Ignore_Bits	(Optional)
Use_Init_Output	(Optional)
Init_Returns_Filter	(Optional)
Tx_Dj	(Tx only, Optional)
Tx_Rj	(Tx only, Optional)
Tx_DCD	(Tx only, Optional)
Rx_Clock_Recovery_Mean	(Rx only, Optional)
Rx_Clock_Recovery_Rj	(Rx only, Optional)
Rx_Receiver_Sensitivity	(Rx only, Optional)

All reserved parameters must contain sub-parameters Usage, Type, and one of the Allowed-Values sub-parameters. Description is optional.

AMI\_Version:

AMI\_Version is of usage Info, type Float, and Value 5.1.

Example of AMI\_Version declaration is:

```
(AMI_Version (Usage Info) (Type Float) (Value 5.1))
```

Init\_Returns\_Impulse:

Init\_Returns\_Impulse is of usage Info and type Boolean. It tells the EDA platform whether the AMI\_Init function returns a modified impulse response. Allowed-Values must be Value. When this value is set to True, the model returns either the impulse response of the filter, or the impulse response of the channel including the equalization of the filter depending on the value of Init\_Returns\_Filter. If GetWave\_Exists is False, AMI\_Init always returns a modified impulse response. If GetWave\_Exists is True, the model writer may set Init\_Returns\_Impulse to False, and not return an impulse response. It is highly recommended that Tx models that have GetWave\_Exists set to True also have Init\_Returns\_Impulse set to True and return a best estimate modified impulse response in order to maximize the effectiveness of Rx Ami\_Init function that do internal optimization based on the channel and Tx equalization.

Example of Init\_Returns\_Impulse declaration is:

```
(Init_Returns_Impulse (Usage Info) (Type Boolean) (Value True))
```

GetWave\_Exists:

GetWave\_Exists is of usage Info and type Boolean. It tells the EDA platform whether the "AMI\_GetWave" function is implemented in this model. Allowed-Value must be Value. Note that if Init\_Returns\_Impulse is set to "False", then Getwave\_Exists MUST be set to "True". Examples of GetWave\_Exists declaration are:

```
(GetWave_Exists (Usage Info) (Type Boolean) (Value True))
```

```
(GetWave_Exists (Value True))
```

Use\_Init\_Output:

Use\_Init\_Output is of usage Info and type Boolean. It tells the EDA platform if it needs to combine the output of AMI\_Init with the waveform. If the model AMI\_GetWave is False the value of Use\_Init\_Ouput parameter must be True. If Use\_Init\_Output=True in a Tx model with an AMI\_GetWave, then the output of the Tx AMI\_GetWave needs to be convolved with the output of Tx AMI\_Init, instead of convolved with the impulse response of the channel alone. If Use\_Init\_Output=True in a Tx model without an AMI\_GetWave, then the output of the Tx stimulus waveform must be convolved with an impulse response that contains both the channel and the output of AMI\_INIT. AMI\_GetWave needs to be convolved with the output of Tx AMI\_Init, instead of convolved with the impulse response of the channel alone.

Use\_Init\_Output=True in an Rx model with an AMI\_GetWave, then the

input to the Rx AMI\_GetWave needs to be convolved with the filter only component of the output of Rx AMI\_Init. If Use\_Init\_Output is not specified in the .ami file then it is assumed to be False.

Allowed-Values must be Value.

Examples of Use\_Init\_Output declaration is:

```
(Use_Init_Output (Usage Info) (Type Boolean) (Value True))
(Use_Init_Output (Value False))
```

Init\_Returns\_Filter:

(WМК, although most often the EDA tool will use the combination of the impulse response input to AMI\_Init and the response of the filter block within the model, there are flows in which the EDA tool needs to use the impulse response of just the filter. To avoid the EDA tool from doing a deconvolution, it is advisable that the AMI\_Init function have the ability to return either the impulse of just the filter, or the combination of the filter and the input impulse response.)

Init\_Returns\_Filter is of usage Info and type Boolean. If it is True, then The AMI\_Init function will return just the impulse response of the filter. If not set, or is False, AMI\_Init will return only the impulse response of the filter convolved with the channel.

Examples of Init\_Returns\_Filter declaration are:

```
(Init_Returns_Filter (Usage Info) (Type Boolean) (Value False))
(Init_Returns_Filter (Value True))
```

Max\_Init\_Aggressors:

Max\_Init\_Aggressors is of usage Info and type Integer. Allowed-Values must be Value. It

tells the EDA platform how many aggressor Impulse Responses the AMI\_Init function is capable of processing.

Example of Max\_Init\_Aggressors declaration is:

```
(Max_Init_Aggressors (Usage Info) (Type Integer) (Value 25))
```

Ignore\_Bits:

Ignore\_Bits is of usage Info and type Float or . Allowed-Value must be Value. It tells the

EDA platform how long the time variant model takes to complete initialization. This parameter is meant for AMI\_GetWave functions that model how equalization adapts to the input stream. The value in this field tells the EDA platform how many bits of the AMI\_Getwave output should be ignored.

Examples of Ignore\_Bits declaration are:

```
(Ignore_Bits (Usage Info) (Type Integer) (Value 100))
(Ignore_Bits (Usage Info) (Type Float) (Value 1.e5))
```

Tx\_Dj:

Tx\_Dj (Transmit Deterministic Jitter) can be of Usage Info, In or Out, of Type Float or UI and of Allowed-Value Value, Range and Corner.

Tx\_Dj is the deterministic jitter of the transmit clock. If the Usage is In, then the EDA tool can assume that Tx\_Dj will be implemented in the Tx AMI\_GetWave function. If of type Float, then its units are in seconds.

Example of Tx\_Dj declaration is:

```
(Tx_Dj (Usage In) (Type UI) (Value .1))
```

Tx\_Rj:

Tx\_Rj (Transmit Random Jitter) can be of Usage Info, In or Out, of Type Float or UI and of Allowed-Value Value, Range and Corner. Tx\_Rj is the random jitter of the transmit clock. If the Usage is In, then the EDA tool can assume that Tx\_Rj will be implemented in the Tx AMI\_GetWave funtion. If of type Float, then its units are in seconds. Example of Tx\_Rj declaration is:

```
(Tx_Rj (Usage Info) (Type UI) (Value .05))
```

Tx\_DCD:

Tx\_DCD (Transmit Duty Cycle Distortion) can be of Usage Info, In or Out. It can be of Type Float and UI and can have Allowed-Value of Value, Range and Corner. It tells the EDA platform the maximum percentage deviation of the duration of a transmitted pulse from the nominal pulse width. If the Usage is In, then the EDA tool can assume that Tx\_DCD will be implemented in the Tx AMI\_GetWave funtion. If of type Float, then its units are in seconds. Example of Tx\_DCD declaration is:

```
(Tx_DCD (Usage Info) (Type UI) (Value .15))
```

Rx\_Clock\_Recovery\_Mean:

Rx\_Clock\_Recovery\_Mean can be of Usage Info, In or Out, of Type Float or UI and of Allowed-Value Value, Range and Corner. Rx\_Clock\_Recovery\_Mean is the offset of the recovered clock from the center of an average bit. If the Usage is In, then the EDA tool can assume that Rx\_Clock\_Recovery\_Mean will be implemented in the Rx AMI\_GetWave funtion. If of type Float, then its units are in seconds. Example of Rx\_Clock\_Recovery\_Mean declaration is:

```
(Rx_Clock_Recovery_Mean (Usage Info) (Type UI) (Value .15))
```

Rx\_Clock\_Recovery\_Rj:

Rx\_Clock\_Recovery\_Rj can be of Usage Info, In and Out, of Type Float or UI and of Allowed-Value Value, Range and Corner. Rx\_Clock\_Recovery\_Rj is sigma of the Gaussian distribution of the recovered clock around the clock mean. If the Usage is In, then the EDA tool can assume that Rx\_Clock\_Recovery\_Rj will be implemented in the Rx AMI\_GetWave funtion. If of type Float, then its units are in seconds. Example of Rx\_Clock\_Recovery\_Rj declaration is:

```
(Rx_Clock_Recovery_Rj (Usage Info) (Type UI) (Value .05))
```

Rx\_Receiver\_Sensitivity:

Rx\_Receiver\_Sensitivity can be of Usage Info, In, or Out and of Type Float and of Allowed-Value Value, Range and Corner. Rx\_Receiver\_Sensitivity is the voltage needed at the receiver data decision point to ensure proper sampling of the equalized signal. In this example, 100 mV (above +100 mV or below -100 mV) is needed to ensure the

signal is sampled correctly. Units are in Volts.

Example of Rx\_Receiver\_Sensitivity declaration is:

```
(Rx_Receiver_Sensitivity (Usage Info) (Type Float) (Value .1))
```

InOut

Model Specific Parameters:

The Following section describes the user-defined parameters. The algorithmic model expects these parameters and their values to function appropriately. The model maker can specify any number of user defined parameters for their model.

The user defined parameters must be in the following format:

```
(<parameter_name> (usage <usage>) (Type <data type>)  
                  (Allowed Values)) [(Default <values>)]  
                  (Description <string>))
```

A tapped delay line can be described by creating a separate parameter for each tap weight and grouping all the tap weights for a given tapped delay line in a single parameter group which is given the name of the tapped delay line. If in addition the individual tap weights are each given a name which is their tap number (i.e., "-1" is the name of the first precursor tap, "0" is the name of the main tap, "1" is the name of the first postcursor tap, etc.) and the tap weights are declared to be of type Tap, then the EDA platform can assume that the individual parameters are tap weights in a tapped delay line, and use that assumption to perform tasks such as optimization. The model developer is responsible for choosing whether or not to follow this convention.

The type Tap implies that the parameter takes on floating point values. Note that if the type Tap is used and the parameter name is not a number (except for Limit and Scale , this is an error condition for which EDA platform behavior is not specified.

Tap parameter names Limit and Scale are used to adjust Tap values. A Tap may have a Scale, a Limit, or neither. If Scale is specified then the sum of the absolute values of all of the Taps must equal Scale. If Limit is specified then the Taps are scaled by Limit/(maximum value of the absolute values of all of the Taps). Scale and Limit must be Usage Info, Type Tap, and Allowed-Value Value)

Array

If a branch has multiple leaves, and one of the leafs is Array, and the value of Array is True, then the parameter tree that is passed into the model, and returned from the model will use the branch as the parameter name, and the values of all of the leaves of the branch (except the Array, Scale, and Limit leaves) will be passed as a white space delimited string.

```

=====

| 1 OVERVIEW

| =====

| The algorithmic model of a Serializer-Deserializer (SERDES) transmitter or  
| receiver consists of three functions: 'AMI\_Init', 'AMI\_GetWave' and  
| 'AMI\_Close'. The interfaces to these functions are designed to support  
| three different phases of the simulation process: initialization,  
| simulation of a segment of time, and termination of the simulation.

| These functions ('AMI\_Init', 'AMI\_GetWave' and 'AMI\_Close') should all be

supplied in a single shared library, and their names and signatures must be as described in this section. If they are not supplied in the shared library named by the Executable sub-parameter, then they shall be ignored. This is acceptable so long as

1. The entire functionality of the model is supplied in the shared library.
2. All termination actions required by the model are included in the shared library.

The three functions can be included in the shared object library in one of the two following combinations:

- Case 1: Shared library has AMI\_Init, AMI\_Getwave and AMI\_Close.
- Case 2: shared library has AMI\_Init and AMI\_Close.
- Case 3: Shared library has only AMI\_Init.

Please note that the function 'AMI\_Init' is always required.

The interfaces to these functions are defined from three different perspectives. In addition to specifying the signature of the functions to provide a software coding perspective, anticipated application scenarios provide a functional and dynamic execution perspective, and a specification of the software infrastructure provides a software architecture perspective. Each of these perspectives is required to obtain interoperable software models.

## 2 APPLICATION SCENARIOS

=====

Arpad to rewrite this section.

## 3 FUNCTION SIGNATURES

=====

### 3.1 AMI\_Init

=====

#### 3.1.1 Declaration

=====

```
long AMI_Init (double *impulse_matrix,
              long row_size,
              long aggressors,
              double sample_interval,
              double bit_time,
              char *AMI_parameters_in,
              char **AMI_parameters_out,
              void **AMI_memory_handle,
              char **msg)
```

### 3.1.2 Arguments

#### 3.1.2.1 impulse\_matrix

Impulse matrix is the channel impulse response matrix. The impulse values are in volts and are uniformly spaced in time. The sample spacing is given by the parameter 'sample\_interval'.

AMI\_Init should be written to support a null \*\*AMI\_memory\_handle. In this case, the AMI\_Init will ignore any data, if any, in \*impulse\_matrix and will still return \*\*AMI\_parameters\_out, and \*\*msg. If \*\*AMI\_memory\_handle is null then AM\_Close will still need to be called before the next call to AMI\_Init. The intent of this entry is to allow the model developer to implement computational expressions to recalculate AMI parameters base on the selected value of other AMI parameters. (WMK: I suspect we will need a new Reserved Parameter Computational\_Entry that tells the EDA tool that AMI\_Init has this computational capability.)

The 'impulse\_matrix' is stored in a single dimensional array of floating point numbers which is formed by concatenating the columns of the impulse response matrix, starting with the first column and ending with the last column. The matrix elements can be retrieved /identified using

```
impulse_matrix[idx] = element (row, col)
idx = col * number_of_rows + row
row - row index , ranges from 0 to row_size-1
col - column index, ranges from 0 to aggressors
```

The first column of the impulse matrix is the impulse response for the primary channel. The rest are the impulse responses from aggressor drivers to the victim receiver.

The impulse response of a short lossless channel is a rectangle with a width equal to sample\_interval (in other words, one discrete sample) and a height of 1/sample\_interval (to get the unit area).

The impulse response of a short lossless channel would be element[0,0]=1/sample\_interval, element[n] = 0 for all n != 0. If the channel was lossless but had a length of 30.3 sample\_intervals, then element[30,0]=.667/sample\_interval, element[31,0]=.333/sample\_interval, element[n] = 0 for all n != 30 and 31.

The AMI\_Init function may return a modified impulse response by modifying the first column of impulse\_matrix. If the impulse response is modified, the new impulse response is expected to represent the concatenation of the model block with the blocks represented by the input impulse response if Init\_Returns\_Filter is False, or is not specified. If Init\_Returns\_Filter is True the AMI\_Init function will return an impulse response of the model block only.

The aggressor columns of the matrix should not be modified.

#### 3.1.2.2 row\_size

The number of rows in the impulse matrix.

#### 3.1.2.3 aggressors

| The number of aggressors in the impulse matrix.

#### | 3.1.2.4 sample\_interval:

| =====

| This is the sampling interval of the impulse matrix. Sample\_interval is usually a fraction of the highest data rate (lowest bit\_time) of the device. Example:

```
| Sample_interval = (lowest_bit_time/64)
```

#### | 3.1.2.5 bit\_time

| =====

| The bit time or unit interval (UI) of the current data, e.g., 100 ps, 200 ps etc. The shared library may use this information along with the impulse matrix to initialize the filter coefficients.

#### | 3.1.2.6 AMI\_parameters (\_in and \_out)

| =====

| Memory for AMI\_parameters\_in is allocated and de-allocated by the EDA platform. The memory pointed to by AMI\_parameters\_out is allocated and de-allocated by the model. This is a pointer to a string. All the input from the IBIS AMI parameter file are passed using a string that been formatted as a parameter tree.

| Examples of the tree parameter passing is:

```
| (dll
|   (tx
|     (taps 4)
|     (spacing sync)
|   )
| )
```

| and

```
| (root
|   (branch1
|     (parameter1 value1)
|     ( parameter2 value2)
|     (branch2
|       ( parameter3 value3)
|       ( parameter4 value4)
|     )
|     ( parameter5 value5 value6 value7)
|   )
| )
```

| Note that the only way a parameter can pass more than one value is if the parameter is a branch with the sub-parameter Array True.

| The syntax for this string is:

- | 1. Neither names nor individual values can contain white space characters.

- White space is allowed between a pair of double quotes that delimitate a string.
2. Parameter name/value pairs are always enclosed in parentheses, with the value separated from the name by white space.
  3. A parameter value in a name/value pair can be either a single value or a list of values separated by whitespace.
  4. Parameter name/value pairs can be grouped together into parameter groups by starting with an open parenthesis followed by the group name followed by the concatenation of one or more name/value pairs followed by a close parenthesis.
  5. Parameter name/values pairs and parameter groups can be freely intermixed inside a parameter group.
  6. The top level parameter string must be a parameter group.
  7. White space is ignored, except as a delimiter between the parameter name and value.
  8. Parameter values can be expressed either as a string literal, decimal number or in the standard ANCI 'C' notation for floating point numbers (e.g., 2.0e-9). String literal values are delimited using a double quote (") and no double quotes are allowed inside the string literals. White space is allowed between the double quotes delimiting a string. Strings that do not contain white space, "(, ")", "' or \," do not require double quotes.
  9. A parameter can be assigned an array of values by enclosing the parameter name and the array of values inside a single set of parentheses, with the parameter name and the individual values all separated by white space.

The modified BNF specification for the syntax is:

```

<tree>:
  <branch>

<branch>:
  ( <branch name> <leaf list> )

<leaf list>:
  <branch>
  <leaf>
  <leaf list> <branch>
  <leaf list> <leaf>

<leaf>:
  ( <parameter name> whitespace <value list> )

<value list>:
  <value>
  <value list> whitespace <value>

<value>:
  <string literals>
  <decimal number>
  <decimal number>e<exponent>
  <decimal number>E<exponent>

```

### 3.1.2.7 AMI\_memory\_handle

Used to point to local storage for the algorithmic block being modeled and shall be passed back during the AMI\_GetWave calls. e.g. a code snippet may

| look like the following:

```
| my_space = allocate_space( sizeof_space );  
| status = store_all_kinds_of_things( my_space );  
| *sedes_memory_handle = my_space;
```

| The memory pointed to by AMI\_handle is allocated and de-allocated by the model.

### | 3.1.2.8 msg (optional)

=====  
| Provides descriptive, textual message from the algorithmic model to the EDA platform. It must provide a character string message that can be used by EDA platform to update log file or display in user interface.

### | 3.1.3 Return Value

=====  
| 1 for success  
| 0 for failure

## | 3.2 AMI\_GetWave

### | 3.2.1 Declaration

```
| long AMI_GetWave (double *wave,  
|                  long wave_size,  
|                  double *clock_times,  
|                  char **AMI_parameters_out,  
|                  void *AMI_memory);
```

### | 3.2.2 Arguments

#### | 3.2.2.1 wave

=====  
| An array of a time domain waveform, sampled uniformly at an interval specified by the 'sample\_interval' specified during the init call. The wave is both input and output. The EDA platform provides the wave. The algorithmic model is expected to modify the waveform in place by applying a filtering behavior, for example, an equalization function, being modeled in the AMI\_Getwave call.

| Depending on the EDA platform and the analysis/simulation method chosen, the input waveform could include many components. For example, the input waveform could include:

- | - The waveform for the primary channel only.
- | - The waveform for the primary channel plus crosstalk and amplitude noise.
- | - The output of a time domain circuit simulator such as SPICE.

| It is assumed that the electrical interface to either the driver or the

| receiver is differential. Therefore, the sample values are assumed to be  
| differential voltages centered nominally around zero volts. The  
| algorithmic model's logic threshold may be non-zero, for example to model  
| the differential offset of a receiver; however that offset will usually be  
| small compared to the input or output differential voltage.

| The output waveform is expected to be the waveform at the decision point of  
| the receiver (that is, the point in the receiver where the choice is made  
| as to whether the data bit is a "1" or a "0"). It is understood that for  
| some receiver architectures, there is no one circuit node which is the  
| decision point for the receiver. In such a case, the output waveform is  
| expected to be the equivalent waveform that would exist at such a node  
| were it to exist.

#### | 3.2.2.2 wave\_size

| =====

| Number of samples in the waveform array.

#### | 3.2.2.3 clock\_times

| =====

| Array to return clock times. The clock times are referenced to the start  
| of the simulation (the first AMI\_GetWave call). The time is always  
| greater or equal to zero. The last clock is indicated by putting a value  
| of -1 at the end of clocks for the current wave sample. The clock\_time  
| array is allocated by the EDA platform and is guaranteed to be greater  
| than the number of clocks expected during the AMI GetWave call. The clock  
| times are the times at which clock signal at the output of the clock  
| recovery loop crosses the logic threshold. It is to be assumed that the  
| input data signal is sampled at exactly one half bit\_time after a  
| clock time.

| (WMK Arpad may want to incorporate comments on the care that is needed to calculate  
| clock\_times because of numerical precision accumulation errors if not done carefully.  
| Incrementing times by sample\_interval can introduce errors in excess of  
| one bit time after simulations > 10\*\*8 bits.

#### | 3.2.2.4 AMI\_parameters\_out (optional)

| =====

| A handle to a 'tree string' as described in 1.3.1.2.6. This is used by the  
| algorithmic model to return dynamic information and parameters. The memory  
| for this string is to be allocated and deleted by the algorithmic model.

#### | 3.2.2.5 AMI\_memory

| =====

| This is the memory which was allocated during the init call.

#### | 3.2.2.6 Return Value

| =====

| 1 for success

| 0 for failure

### | 3.3 AMI\_Close

```

| =====
|
| 3.3.1 Declaration
| =====
|
|     long AMI_Close(void * AMI_memory);
|
| 3.3.2 Arguments
| =====
|
| 3.3.2.1 AMI_memory
| =====
|
| Same as for AMI_GetWave.  See section 3.2.2.4.
|
| 3.3.3 Return Value
| =====
|
| 1 for success
| 0 for failure
|
|
| 4 CODE SEGMENT EXAMPLES
| =====
|
| extern long AMI_GetWave (wave, wave_size, clock_times, AMI_memory);
|
|     my_space = AMI_memory;
|
|     clk_idx=0;
|     time = my_space->prev_time + my_space->sample_interval;
|     for(i=0; i<wave_size; i++)
|     {
|         wave = filterandmodify(wave, my_space);
|         if (clock_times && found_clock (my_space, time))
|             clock_times[clk_idx++] = getclocktime (my_space, time);
|         time += my_space->sample_interval;
|     }
|     clock_times[clk_idx] = -1;    //terminate the clock array
|     Return 1;
|
| *****

```

ANALYSIS PATH/DATA THAT LED TO SPECIFICATION:

This section of the IBIS specification has been driven primarily by the following factors:

1. The interaction between a SERDES and the system surrounding it is quite complex, thus requiring sophisticated and detailed modeling.
2. There is considerable variation in the architectures and circuit techniques used in SERDES devices.
3. There is not a commonly accepted set of parameters that can be measured to fully and reliably characterize the performance of a given SERDES device independently from the system that surrounds it.

Because of these factors, IP vendors' experience has been that customers use the models delivered by the IP vendor as a form of performance specification. If the model predicts a level of performance in a given application, then the IP is held to that level of performance or better when the system is tested.

For this reason, IP vendors are reluctant to supply any but most detailed and accurate models they can produce. This is a fundamental shift in that in the past, the models that were presumed to be utterly complete and reliable were SPICE models, and IBIS models were understood to be a useful approximation that could be shared without divulging sensitive proprietary information.

By setting the algorithmic model as the primary deliverable, this specification maximizes the flexibility available to the model developers and also maximizes the degree of protection for proprietary information. By standardizing the interface to these algorithmic models, this specification also enables the required degree of interoperability.
