ISSUE TITLE:
                Algorithmic Modeling API (AMI) Improvements
REQUESTER: (in alphabetical order by company)
                                                                                                        Deleted:
            Adge Hawes, IBM;
           Arpad Muranyi, Mentor Graphics;
           Walter Katz, Mike Steinberger, Todd Westerhoff, SiSoft
DATE SUBMITTED:
Date of Draft: 01/12/2010
DATE REVISED:
DATE ACCEPTED BY IBIS OPEN FORUM: PENDING
STATEMENT OF THE ISSUE:
Based on the experiences of several EDA vendor and IC vendor implementations
of AMI models and EDA software using AMI models it has become apparent that
a number of changes to the document are required \overline{\text{to correct the reference flow}},
clarify the specification and simplify both the development of AMI models and EDA
software using AMI models.
Existing known AMI models and .ami files will work with these changes.
Section 6c and 10 are to be replaced with the following.
Summary of significant changes
     Change Reference Flows
      Remove Branches
            Reserverd_Parameters
            Model_Specific
      Remove Reserved Parameters
            Tx Jitter
           Rx Clock PDF
     Add Reserved Parameters
            Tx Dj
            Tx Rj
            Rx Clock Recovery Mean
            Rx Clock Recovery Rj
            Init Returns Filter
      Remove Keywords
            <u>Format</u>
            Gaussian
            <u>Table</u>
            DjRj
           Dual-Dirac
     Ad<u>d Keywords</u>
            Array
            Scale
            Limit
            Labels
            Value
            Range
            Increment

Section 6c
          ALGORITHMIC MODEL API SUPPORT
INTRODUCTION:
Executable shared library files to model advanced Serializer-Deserializer
(SERDES) devices are supported by IBIS. This chapter describes how
executable models written for these devices can be referenced and used by
IBIS files.
The shared objects use the following keywords within the IBIS framework:
  [Algorithmic Model]
  [End Algorithmic Model]
The placement of these keywords within the hierarchy of IBIS is shown in
the following diagram:
  |-- [Component]
     ١ ...
     | ...
  I-- [Model]
      | ...
      |-- [Algorithmic Model]
     |-- [End Algorithmic Model]
    | ...
  1 ...
  | ...
Figure 1: Partial keyword hierarchy
GENERAL ASSUMPTIONS:
This proposal breaks SERDES device modeling into two parts - electrical
and algorithmic. The combination of the transmitter's analog back-end, the
serial channel and the receiver's analog front-end are assumed to be linear
and time invariant. There is no limitation that the equalization has to be linear and time invariant. The "analog" portion of the channel is
characterized by means of an impulse response leveraging the pre-existing
IBIS standard for device models.
The transmitter equalization, receiver equalization and clock recovery
circuits are assumed to have a high-impedance (electrically isolated)
connection to the analog portion of the channel. This makes it possible to
model these circuits based on a characterization of the analog channel.
```

<u>wkatz</u> <u>Page 3</u> <u>1/14/2010</u>

 \mid The behavior of these circuits is modeled algorithmically through the use \mid of executable code provided by the SERDES vendor. This proposal defines the

 \mid functions of the executable models, the methods for passing data to and \mid from these executable models and how the executable models are called from \mid the EDA platform.

<u>wkatz</u> <u>Page 4</u> <u>1/14/2010</u>,

```
The DLL does not read the .ami file. The EDA tool uses the contents of the .ami file to:
    Specify flows that the model supports.
    Configures the model for specific silicon implementations.
    Configures the model for specific model programming.
    Tells the EDA tool how to analyze the model output.
    Tells the EDA tool what parameters are returned from the model.
AMI parameters are passed into the model and returned from the model using a parameter tree
syntax. Please see section \mid 3.1.2.6 AMI parameters for a detailed description of the
parameter tree syntax.
In this section, sub-parameter is a leaf under a parameter that describes the Type, Usage,
Allowed Values, and Description of the parameter.
A leaf is a parameter if the leaf only contains sub-parameters.
The .ami file is in essentially the same format as the string passed into and returned
from the model except that in place of the parameter value, the .ami file contains
sub-parameters.
The string passed into the model only contains Usage In, and InOut parameters. The string passed
back from the model only contains Usage InOut and Out parameters.
A parameter tree contains a root, branches and leaves. The leaves of the parameter tree are
AMI Parameters. Only leaves may have sub-parameters, except that the root and branches may have
the sub-parameter Description.
AMI-Parameters can either be Reserved Parameters or Model Specific Parameter.
A branch may not contain two leaves or branches of the same name.
The root and branch names are case sensitive, and must start with a letter [a-Z], and may
contain letters [a-Z], numbers [0-9], and underscore [].
Parameter names are case sensitive, and must start with a letter [a-Z], and may contain letters
[a-Z], numbers [0-9], and underscore [], except tap parameter leaves which must be a positive
integer, negative integer or zero. By convention reserved parameters will be a leaf off the root and start with a capital letter [A-Z]. It is highly recommended that two parameter names
should not differ by case alone.
If a parameter has more than one sub-parameter, the order of the sub-parameters is unimportant.
If a branch contains two or more branches or leaves, the order of the branches and leaves is
not important
The following sub-parameter names are not allowed parameter names.
   Туре
   Usage
   Description
   Value
   Range
```

Deleted: 1/12/2010

The parameter definition file (.ami) is an ASCII file that the EDA tool reads.

 Environment Variables
     Parameter values may reference a file name. These parameters must be of type String. If the
      string begins with a "$", then the string between the $ and the first / in the string
      shall be a computer system environment parameter that must be defined by the EDA tool.
     A special environment variable AMISearchPath shall contain a list of directories that
     the EDA tool shall search sequentially to find the file.
      Environment Variables are used by the EDA tool or AMI check routine. All file names
     will be fully resolved by the EDA tool prior to them being passed to a DLL
  Sub-Parameter Definitions
    Usage: (Required)
             Parameter is required Input to executable
     Ιn
     Out.
             Parameter is Output only from executable
      Info
             Information for user or EDA platform
      InOut Required Input to executable. Executable may return a different
             value.
    Type: (Required)
      Float
         Can be specified as an integer, decimal number, or in exponential format.
      Integer
         Can be positive, negative or zero.
      String
         Strings begin and end with a double quote (") and no double quotes are
         allowed inside the string literals. A null string is denoted by " " or "".
         Carriage Return <CR> and Line Feed <LF> and End of Line <EOL> are explicitly
                  allowed.
                                                                                                            Deleted: not?
                                                                                                            Deleted: There shall be no
         If a string references a file name, then there shall be no white space in the string
                                                                                                            limit on the length of a String, or the number of
         and the Unix "/" shall delineate folders on all
         platforms including Windows.
                                                                                                            lines in a String.
     Boolean
         Values allowed are True and False.
         The leaves of a branch represent Tx or Rx equalization coefficients.
         Values shall be Float
          Unit Interval, 1 UI is the inverse of the data rate frequency,
          for example 1 UI of a channel operating at 10 Gb/s is 100ps)
Bob, Does not want to introduce NA.
| Allowed_Values: (Required for Info, In and InOut) and has to be one of the following
  (default is NA?) (NA not allowed for Info) (Do we support NA?)
                                                                                                            Deleted: 1/12/2010

<u>wkatz</u> <u>Page</u> 7 <u>1/14/2010</u>

```
Default <value>: (Optional)
      Depending on the Type, <value> will provide a default value for the
      parameter. For example, if the Type is Boolean, <value> could be True
      or False, if the Type is Integer, the <value> can be an integer value.
      Default is not allowed if Allowed-Value is Corner.
      If Default is not specified, then the default value of a parameter shall depend
      on the Allowed-Value. If Default is specified then it must be a legal Allowed-Value.
         Value:
                     <value>
                     <typ>
         Range:
         List:
                     <value1>
         Label:
                     NA
                                                                                                                (Rx Clock PDF¶
                     NA
         Corner:
                                                                                                                Info)¶
         Increment: <typ>
                     <typ>
         Steps:
                                                                                                                Float)¶
                                                                                                                Table¶
    Description <string>: (Required for Model Specific Parameters)
      ASCII string following Description describes a reserved parameter,
                                                                                                                Density)¶
      model specific parameter, a branch within the parameter tree
      or the Algorithmic model itself. It is used
                                                                                                                0.1 1e-35)¶
      by the model make to convey information to the EDA platform and for the EDA platform
                                                                                                                0.98 2e-35)¶
      to convey information to the end-user.
      There shall be no limit on the length of a Description, or the number of lines
      in a Description, however, the model developer should assume that the first
                                                                                                                1e-2)¶
       .28 characters of the first line be at minimum an abstract of the full description.
      The location of Description will determine whether to description applies to a parameter,
                                                                                                                0.98 2e-35)¶
      branch or model.
                                                                                                                0 1 1e-35)¶
                                                                                                                Table¶
                                                                                                                Rx\_Clock\_PDF\P
  Every (not Out) parameter must have one, and only one of the following "Allowed-Value" sub-
                                                                                                                <mean> <sigma>¶
parameters:
      Value
      Range
      Corner
      Increment
                                                                                                                Deleted: The entire \P
      Steps
 Note that in the context of Algorithmic Model for type 'Corner', <slow
                                                                                                                specification.
  value> and <fast value> align implicitly to slow and fast corners, and
                                                                                                                Deleted:
  <slow value> does not have to be less than <fast value>. For type 'Range'
                                                                                                                Deleted: String¶
 and 'Increment', <min value>, <max value> does not imply slow and fast
 corners.
    a Reserved Parameter must have one and only one Usage, Usage is optional.
  If a Reserved Parameter must have one and only one Type, Type is optional.
                                                                                                                Deleted: |
 Notes:
 1. Throughout the section, text strings inside the symbols "<" and ">" \,
 should be considered to be supplied or substituted by the model maker. Text strings inside "<" and ">" are not reserved and can be replaced.
\mid 2. Throughout the document, terms "long", "double" etc. are used to

IBIS-AMI Conventions

<u>In</u>

Parameters defined as **Usage In** are presented to the user in the EDA tool solution space if the user can control them, then formatted and presented to the algorithmic model as part of the AMI_Init call. The EDA tool does **NOT** perform any special processing on parameters defined as **Usage In**. A parameter defined as **Usage In** cannot affect the results of Network Characterization, but may affect the results of both Statistical and Time Domain simulation by changing the model's output.

InOut

Parameters defined as **Usage InOut** are presented to the user in the EDA solution space if the user can control them, then formatted and presented to the algorithmic model as part of the AMI_Init call. The model may also report values for this parameter via the AMI Parameters_Out interface. The EDA tool may simply report the data output by the model or may use it to perform additional processing, based on the specific parameter in question. A parameter defined as **Usage InOut** cannot affect the results of Network Characterization, but may affect the results of both Statistical and Time Domain simulation, either by changing the model's output or by affecting additional processing.

Out

The algorithmic model may report values for parameters defined as **Usage Out** via the AMI Parameters_Out interface. The EDA tool may simply report the data output by the model or may use it to perform additional processing, based on the specific parameter in question. A parameter defined as **Usage Out** cannot affect the results of Network Characterization, but may affect the results of both Statistical and Time Domain simulation, either by changing the model's output or by affecting additional processing.

Info

Parameters defined as **Usage Info** are presented to the user in the EDA solution space if the user can control them and are used only by the simulator. These parameters may control the analysis flow, supply additional data that gets factored into the analysis or control other aspects of the analysis. Parameters defined as **Usage Info** are **NEVER** presented to algorithmic models via the AMI_Init call. A parameter defined as **Usage Info** can affect the results of Network Characterization, Statistical and Time Domain simulation.

KEYWORD DEFINITIONS:

Keywords: [Algorithmic Model], [End Algorithmic Model]

Required: No

Description: Used to reference an external compiled model. This compiled model encapsulates signal processing functions. In the case of a receiver it may additionally include clock and data recovery functions. The compiled model can receive and modify waveforms with the analog channel, where the analog channel consists of the transmitter output stage, the transmission channel itself and the receiver input stage. This data exchange is implemented through a set of software functions. The signature of these functions is elaborated in section 10 of this document. The function interface must comply with ANSI 'C' language.

Sub-Params: Executable

Usage Rules: The [Algorithmic Model] keyword must be positioned within a [Model] section and it may appear only once for each [Model] keyword in a .ibs file. It is not permitted under the [Submodel] keyword.

> The [Algorithmic Model] always processes a single waveform regardless whether the model is single ended or differential. When the model is differential the waveform passed to the [Algorithmic Model] must be a difference waveform.

[Algorithmic Model], [End Algorithmic Model] Begins and ends an Algorithmic Model section, respectively.

Subparameter Definitions:

Executable:

Three entries follow the Executable subparameter on each line:

Platform_Compiler_Bits File_Name Parameter_File

The Platform_Compiler_Bits entry provides the name of the operating system, compiler and its version and the number of bits the shared object library is compiled for. It is a string without white spaces, consisting of three fields separated by an underscore '_'. The first field consists of the name of the operating system followed optionally by its version. The second field consists of the name of the compiler followed by optionally by its version. The third field is an integer indicating the platform architecture. If the version for either the operating system or the compiler contains an underscore, it must be converted to a hyphen '-'. This is so that an underscore is only present as a separation character in the entry.

Bob, (Require AMI Version?)

All reserved parameters must contain sub-parameters Usage, Type, and one of the Allowed-Values sub-parameters. Description is optional.

only one Usage, Usage is optional. If a Reserved Parameter must have one and only one Type, Type is optional." on page 7 and some examples. AMI Version:

AMI Version is of usage Info, type Float, and Value 5.1. Example of AMI_Version declaration is: (AMI_Version (Usage Info)(Type Float) (Value 5.1))

Init Returns Impulse:

Init_Returns_Impulse is of usage Info and type Boolean. It tells the EDA platform whether the AMI_Init function returns a modified impulse response. <u>Allowed-Values must be Value.</u> When this value is set to True, the model returns either the impulse response of the filter, or the impulse response of the channel including the equalization of the filter depending on the value of Init Returns Filter. If GetWave Exists is False, AMI Init always returns a modified impulse response. If GetWave Exists is True, the model writer may set Init Returns Impulse to False, and not return an impulse response. It is highly recommended that Tx models that have GetWave Exists set to True also have Init Returns Impulse set to True and return a best estimate modified impulse response in order to maximize the effectiveness of Rx Ami Init function that do internal optimization based on the channel and Tx equalization.

Example of Init_Returns_Impulse declaration is:

(Init Returns Impulse (Usage Info) (Type Boolean) (Value True))

GetWave Exists:

Deleted: model parameter file must have a sub-tree with the \P heading 'Reserved_Parameters' sub-tree shall contain¶ reserved parameters for the

The

following reserved parameters are used by the EDA tool¶ and are required if the [Algorithmic Model] keyword is ¶ present. The entries following the reserved parameters¶ points to its usage, type and default value. All reserved \P parameters must be in the following format:¶

(parameter_name (Usage <usage>)(Type <data_type>)¶ (Default <values>)

(Description <string>))

Deleted:

model returns the convolution of the input impulse¶ response with

the impulse response of the equalization

```
GetWave_Exists is of usage Info and type Boolean. It tells
                the EDA platform whether the "AMI_GetWave" function is
                implemented in this model. Allowed-Value must be Value.
                Note that if Init_Returns_Impulse
                is set to "False", then Getwave_Exists MUST be set to "True".
                Examples of GetWave Exists declaration are:
                   (GetWave_Exists (Usage Info)(Type Boolean) (Value True))
                   (GetWave Exists (Value True))
                Use Init Output:
                Use Init Output is of usage Info and type Boolean. It
                tells the EDA platform if it needs to combine the output of
                AMI Init with the waveform. If the model AMI GetWave is False
                the value of Use Init Ouput parameter must be True.
                If Use Init Output=True in a Tx model with an AMI GetWave, then the
                output of the Tx AMI_GetWave needs to be convolved with the output of Tx
                AMI_Init, instead of convolved with the impulse response of the channel
                alone. If Use Init Output=True in a Tx model without an AMI_GetWave, then the
                output of the Tx stimulus waveform must be convolved with an impulse response
                that contains both the channel and the output of AMI_INIT.
                AMI GetWave needs to be convolved with the output of Tx
                AMI Init, instead of convolved with the impulse response of the channel
Use Init Output=True in an Rx model with an AMI GetWave, then the
                input to the Rx AMI_GetWave needs to be convolved with the filter only
                component of the output of Rx AMI Init. If Use Init Output is not
                specified in the .ami file then it is assumed to be False.
                Allowed-Values must be Value.
                Examples of Use Init Output declaration is:

(Use Init Output (Usage Info)(Type Boolean) (Value True))
                   (Use Init Output (Value False))
                                                                                                                 Deleted: |
                                                                                                                 following reserved
                                                                                                                 parameters are optional. If
                Init Returns Filter:
                                                                                                                 these¶
                (WMK, although most often the EDA tool will use the combination of the impulse
                                                                                                                              parameters
                response input to AMI Init and the response of the filter block within the model,
                                                                                                                 are not present, the values are assumed as "0".
                there are flows in which the EDA tool needs to use the impulse response of just
                the filter. To avoid the EDA tool from doing a deconvolution, it is advisable that
                the AMI_Init function have the ability to return either the impulse
                of just the filter, or the combination of the filter and the input impulse
                response.)
Kumar, How does this combination prevents deconvolution/other techniques to derive the filter response?)
                Init_Returns_Filter is of usage Info and type Boolean. If it is True, then
                The AMI Init function will return just the impulse response of the filter. If not set, or is False, AMI Init will return only the impulse response
                of the filter convolved with the channel.
                Examples of Init Returns Filter declaration are:
                   (Init Returns Filter (Usage Info)(Type Boolean) (Value False))
                   (Init Returns Filter (Value True))
                                                                                                                 Deleted: 1/12/2010

Kumar, does that mean parameter in and parameter out need not be consistent?

Yes, they do not need to be consistent.

_____
```

The algorithmic model of a Serializer-Deserializer (SERDES) transmitter or receiver consists of three functions: 'AMI Init', 'AMI GetWave' and 'AMI Close'. The interfaces to these functions are designed to support three different phases of the simulation process: initialization, simulation of a segment of time, and termination of the simulation.

These functions ('AMI Init', 'AMI GetWave' and 'AMI Close') should all be supplied in a single shared library, and their names and signatures must be as described in this section. If they are not supplied in the shared library named by the Executable sub-parameter, then they shall be ignored. This is acceptable so long as

- 1. The entire functionality of the model is supplied in the shared library.
- 2. All termination actions required by the model are included in the shared library.

The three functions can be included in the shared object library in one of the two following combinations:

Case 1: Shared library has AMI_Init, AMI_Getwave and AMI_Close.

Case 2: shared library has AMI_Init and AMI_Close. Case 3: Shared library has only AMI_Init.

Please note that the function 'AMI_Init' is always required.

The interfaces to these functions are defined from three different perspectives. In addition to specifying the signature of the functions to provide a software coding perspective, anticipated application scenarios provide a functional and dynamic execution perspective, and a specification of the software infrastructure provides a software architecture perspective. Each of these perspectives is required to obtain interoperable software models.

                   void **AMI_memory_handle,
                   char **msg)
  3.1.2 Arguments
  3.1.2.1 impulse matrix
 Impulse matrix is the channel impulse response matrix. The impulse values
 are in <u>Volts</u> and are uniformly spaced in time. The sample spacing is given by the parameter 'sample_interval'.
                                                                                                                         Deleted: v
Fangyi, Volts or Volt/sec? ( I believe Volts is correct.
_ AMI_Init should be written to support a null **AMI_memory_handle. In this case,
the AMI Init will ignore any data, if any, in *impulse matrix and will still return **AMI parameters out, and **msg. If **AMI memory handle is null then AM Close will
| still need to be called before the next call to AMI Init. The intent of this entry
  is to allow the model developer to implement computational expressions to recalculate
| AMI parameters base on the selected value of other AMI parameters. (WMK: I suspect we
| will need a new Reserved Parameter Computational Entry that tells the EDA
| tool that AMI_Init has this computational capability.)
(WMK) It has been suggested that instead of a null **AMI memory handle, this entry be indicated
by aggressors being -1. Detail TBD.
Kumar, it is proposed that with null memory handle, the model still can return **msg and **AMI parameters out.
The present standard says this memory is owned by the model. Is that still correct?
Yes.
```

1 05.

```
The 'impulse_matrix' is stored in a single dimensional array of floating point numbers which is formed by concatenating the columns of the impulse response matrix, starting with the first column and ending with the last column. The matrix elements can be retrieved /identified using

impulse_matrix[idx] = element (row, col)

idx = col * number_of_rows + row

row - row index , ranges from 0 to row_size-1

col - column index, ranges from 0 to aggressors

The first column of the impulse matrix is the impulse response for the primary channel. The rest are the impulse responses from aggressor drivers to the victim receiver.
```

Deleted: 1/12/2010

wkatz Page 22 1/14/2010

```
| width equal to sample interval (in other words, one discrete sample) and
 a height of 1/sample_interval (to get the unit area).
 The impulse response of a short lossless channel would be element[0,0]=
 1/\text{sample interval}, element[n,0] = 0 for all n != 0. If the channel was lossless but had a length of 30.3 sample intervals, then element[30,0] = .667/\text{sample interval},
 element[31,0]=.333/sample_interval, element[n] = 0 for all n != 30 and 31.
 The AMI Init function may return a modified impulse response by modifying
 the first column of impulse matrix. If the impulse response is modified,
 the new impulse response is expected to represent the concatenation of the
 model block with the blocks represented by the input impulse response, if Init Returns Filter is False, or is not specified. If Init Returns Filter is True
 the AMI Init function will return an impulse response of the model block only.
 The aggressor columns of the matrix should not be modified.
 3.1.2.2 row size
 ______
 The number of rows in the impulse matrix.
 3.1.2.3 aggressors
 _____
 The number of aggressors in the impulse matrix.
 3.1.2.4 sample interval:
 This is the sampling interval of the impulse matrix. Sample_interval is
 usually a fraction of the highest data rate (lowest bit time) of the
 device. Example:
    Sample interval = (lowest bit time/64)
 3.1.2.5 bit_time
 The bit time or unit interval (UI) of the current data, e.g., 100 ps, 200
 ps etc. The shared library may use this information along with the impulse
 matrix to initialize the filter coefficients.
```

| The impulse response of a short lossless channel is a rectangle with a

Note that the only way a parameter can pass more than one value is if the
parameter is a branch with the sub-parameter Array True.
The syntax for this string is:
1. Neither names nor individual values can contain white space characters.
   White space (only blank and tab) is allowed between a pair of double quotes
   delimiting a string.
2. Parameter name/value pairs are always enclosed in parentheses, with the
   value separated from the name by white space.
3. A parameter value in a name/value pair can be either a single value or a
   list of values separated by whitespace.
4. Parameter name/value pairs can be grouped together into parameter groups
   by starting with an open parenthesis followed by the group name followed
   by the concatenation of one or more name/value pairs followed by a close
   parenthesis.
5. Parameter name/values pairs and parameter groups can be freely
   intermixed inside a parameter group.
6. The top level parameter string must be a parameter group.
7. White space is ignored, except as a delimiter between the parameter name
   and value.
                                                                                                             Deleted: decimal
8. Parameter values can be expressed either as a string literal, boolean, integer
   number (e.g. 50) or floating point number in the standard ANCI 'C' notation
                                                                                                             Deleted: for floating point
   (e.g., 2.0e-9). String literal values are delimited using a double
   quote (") and no double quotes are allowed inside the string literals.
                                                                                                             Deleted: 1/12/2010
```

wkatz Page 26 1/14/2010

An array of a time domain waveform, sampled uniformly at an interval specified by the 'sample interval' specified during the init call. The

Depending on the EDA platform and the analysis/simulation method chosen, the input waveform could include many components. For example, the input

wave is both input and output. The EDA platform provides the wave. The algorithmic model is expected to modify the waveform in place by applying a filtering behavior, for example, an equalization function,

| being modeled in the AMI Getwave call.

waveform could include:

```
- The waveform for the primary channel plus crosstalk and amplitude noise.
- The output of a time domain circuit simulator such as SPICE.
It is assumed that the electrical interface to either the driver or the
receiver is differential. Therefore, the sample values are assumed to be
differential voltages centered nominally around zero volts. The
algorithmic model's logic threshold may be non-zero, for example to model
the differential offset of a receiver; however that offset will usually be
small compared to the input or output differential voltage.
The output waveform is expected to be the waveform at the decision point of
the receiver (that is, the point in the receiver where the choice is made
as to whether the data bit is a "1" or a "0"). It is understood that for
some receiver architectures, there is no one circuit node which is the
decision point for the receiver. In such a case, the output waveform is
expected to be the equivalent waveform that would exist at such a node
were it to exist.
3.2.2.2 wave size
Number of samples in the waveform <a href="mailto:array">array</a>.
                                                                                                       Deleted: vector
3.2.2.3 clock_times
______
Array to return clock times. The clock times are referenced to the start of the simulation (the first AMI_GetWave call). The time is always
                                                                                                       Deleted: Vector
greater or equal to zero. The last clock is indicated by putting a value
of -1 at the end of clocks for the current wave sample. The clock_time
array is allocated by the EDA platform and is guaranteed to be greater
                                                                                                       Deleted: vector
than the number of clocks expected during the AMI GetWave call. The clock
times are the times at which clock signal at the output of the clock
recovery loop crosses the logic threshold. It is to be assumed that the
input data signal is sampled at exactly one half bit time after a
                                                                                                       Deleted: clock period
clock time.
(WMK Arpad may want to incorporate comments on the care that is needed to calculate
clock times because of numerical precision accumulation errors if not done carefully.
Incrementing times by sample interval can introduce errors in excess of
one bit time after simulations > 10**8 bits.
3.2.2.4 AMI parameters out (optional)
A handle to a 'tree string' as described in 1.3.1.2.6. This is used by the
algorithmic model to return dynamic information and parameters. The memory
for this string is to be allocated and deleted by the algorithmic model.
3.2.2.5 AMI memory
This is the memory which was allocated during the init call.
3.2.2.6 Return Value
______
                                                                                                       Deleted: 1/12/2010

ANALYSIS PATH/DATA THAT LED TO SPECIFICATION:

This section of the IBIS specification has been driven primarily by the following factors:

- 1. The interaction between a SERDES and the system surrounding it is quite complex, thus requiring sophisticated and detailed modeling.
- $2. \ \ \$ There is considerable variation in the architectures and circuit

<u>wkatz</u> <u>Page 28</u> 1/14/2010

techniques used in SERDES devices.

3. There is not a commonly accepted set of parameters that can be measured to fully and reliably characterize the performance of a given SERDES device independently from the system that surrounds it.

Because of these factors, IP vendors' experience has been that customers use the models delivered by the IP vendor as a form of performance specification. If the model predicts a level of performance in a given application, then the IP is held to that level of performance or better when the system is tested.

For this reason, IP vendors are reluctant to supply any but most detailed and accurate models they can produce. This is a fundamental shift in that in the past, the models that were presumed to be utterly complete and reliable were SPICE models, and IBIS models were understood to be a useful approximation that could be shared without divulging sensitive proprietary information.

By setting the algorithmic model as the primary deliverable, this specification maximizes the flexibility available to the model developers and also maximizes the degree of protection for proprietary information. By standardizing the interface to these algorithmic models, this specification also enables the required degree of interoperability.

tter and Tx_DCD
          These reserved parameters only apply to Tx models.
          parameters are optional; if the parameters are not
fied,
          the values default to "no jitter specified in the model
          jitter). If specified, they must be in the following
t:
```

```
(Format <data format>) (Default
es>)
                             (Description <string>))
          Tx Jitter:
          Tx Jitter can of Usage Info and Out and can be of Type
          or UI. It can be of Data Format Gaussian, Dual-Dirac,
          or Table. It tells the EDA platform how much jitter
          at the input to the transmitter's analog output buffer.
          Several different data formats are allowed as listed.
          Examples of Tx Jitter declarations are:
          (Tx Jitter (Usage Info) (Type Float)
                      (Format Gaussian <mean> <sigma>))
          (Tx Jitter (Usage Info) (Type Float)
                      (Format Dual-Dirac <mean> <mean> <sigma>))
          (Tx Jitter (Usage Info) (Type Float)
                      (Format DjRj <minDj> <maxDj> <sigma>))

- . From the system netlist, the EDA platform determines that a [Model] is described by an IBIS file.
- . From the IBIS file, the EDA platform determines that the [Model] described at least in part by an algorithmic model, and that the AMI_Init function of that model returns an impulse response for [Model].
- . The EDA platform loads the shared library containing the ithmic model, and obtains the addresses of the AMI_Init, AMI_GetWave, AMI Close functions.
- . The EDA platform assembles the arguments for ${\tt AMI_Init.}$ These ${\tt ents}$

include the impulse response of the channel driving the [Model],

handle for the dynamic memory used by the [Model], the eters for configuring the [Model], and optionally the impulse responses of crosstalk interferers.

. The EDA platform calls $\ensuremath{\mathsf{AMI}}\xspace_{\ensuremath{\mathsf{Init}}}$ with the arguments previously red.

- . AMI_Init parses the configuration parameters, allocates dynamic Y, places the address of the start of the dynamic memory in the Y handle, computes the impulse response for the [Model] and passes back to the EDA platform.
- . The EDA platform completes the rest of the simulation/analysis the impulse response from AMI_Init as a complete representation behavior of the given [Model].
- . Before exiting, the EDA platform calls AMI_Close, giving it the
 ss
 in the memory handle for the [Model].
- . AMI_Close de-allocates the dynamic memory for the block and rms whatever other clean-up actions are required.
- . The EDA platform terminates execution.

Nonlinear, and / or Time-variant Equalization Model

From the system netlist, the EDA platform determines that a given is described by an IBIS file.

From the IBIS file, the EDA platform determines that the block is described at least in part by an algorithmic model.

The EDA platform loads the shared library or shared object file containing the algorithmic model, and obtains the addresses of

AMI Init, AMI GetWave, and AMI Close functions.

The EDA platform assembles the arguments for AMI_Init. These ents include the impulse response of the channel driving the block, a efor the dynamic memory used by the block, the parameters for configuring the block, and optionally the impulse responses of crosstalk interferers.

The EDA platform calls ${\tt AMI_Init}$ with the arguments previously red.

AMI_Init parses the configuration parameters, allocates dynamic \mathbf{y} and places the address of the start of the dynamic memory in the \mathbf{y}

handle. AMI_Init may also compute the impulse response of the and pass the modified impulse response to the EDA tool.

A long time simulation may be broken up into multiple time nts .

For each time segment, the EDA platform computes the input

the [Model] for that time segment. For example, if a million are $% \left(\frac{1}{2}\right) =\frac{1}{2}\left(\frac{1}{2}\right) =\frac{1}{2}\left($

to be run, there can be 1000 segments of 1000 bits each, i.e. one segment comprises 1000 bits.

For each time segment, the EDA platform calls the AMI_GetWave ion, giving it the input waveform and the address in the dynamic

handle for the block.

The $AMI_GetWave$ function computes the output waveform for the . In

the case of a transmitter, this is the Input voltage to the $\ensuremath{\text{ver.}}$

In the case of the receiver, this is the voltage waveform at the decision point of the receiver.

The EDA platform uses the output of the receiver $\mathtt{AMI_GetWave}$ ion

to complete the simulation/analysis. For transmitter, it simply the output to the receiver AMI GetWave.

Before exiting, the EDA platform calls AMI_Close, giving it the ss

in the memory handle for the block.

 ${\tt AMI_Close}$ de-allocates the dynamic memory for the block and ${\tt rms}$

whatever other clean-up actions are required.

The EDA platform terminates execution.
