BIRD ID#: TBD
ISSUE TITLE: Algorithmic Modeling API (AMI) Improvements
REQUESTER: (in alphabetical order by company)
Adge Hawes, IBM;
Arpad Muranyi, Mentor Graphics;
Walter Katz, Mike Steinberger, Todd Westerhoff, SiSoft
DATE SUBMITTED:
Date of Draft: 01/19/2010
DATE REVISED:
DATE ACCEPTED BY IBIS OPEN FORUM: PENDING
****

STATEMENT OF THE ISSUE:

Based on the experiences of several EDA vendor and IC vendor implementations of AMI models and EDA software using AMI models it has become apparent that a number of changes to the document are required to correct the reference flow, clarify the specification and simplify both the development of AMI models and EDA software using AMI models.

Existing known AMI models and .ami files will work with these changes.

Section 6c and 10 are to be replaced with the following.

Summary of significant changes

- Change Reference Flows
- Remove Branches
  - Reserverd_Parameters
  - Model_Specific
- Remove Reserved Parameters
  - Tx_Jitter
  - Rx_Clock_PDF
- Add Reserved Parameters
  - Tx_Dj
  - Tx_Rj
  - Rx_Clock_Recovery_Mean
  - Rx_Clock_Recovery_Rj
  - Init_Returns_Filter
- Remove_Keywords
  - Format
  - Gaussian
  - Table
  - DjRj
  - Dual-Dirac
- Add Keywords
  - Array
  - Scale
  - Limit
  - Labels
  - Value
  - Range
  - Increment
  - Step
- Support Environment Variables
- Support AMISearchPath

Deleted: ?

Deleted:

Deleted: 1/19/2010

Issues to be resolved

1. <CR> <LF> in strings
2. Max length of a string
3. Environment variables
4. NA in Allowed Values
5. Clarify Root, Branch, Leaf, Parameter, Sub-Parameter

Formatted: Bullets and Numbering

Deleted: 1/19/2010

| INTRODUCTION:
|
| Executable shared library files to model advanced Serializer-Deserializer
| (SERDES) devices are supported by IBIS. This chapter describes how
| executable models written for these devices can be referenced and used by
| IBIS files.
|
| The shared objects use the following keywords within the IBIS framework:
|
| [Algorithmic Model]
| [End Algorithmic Model]
|
| The placement of these keywords within the hierarchy of IBIS is shown in
| the following diagram:
|
| |-- [Component]
| | | ...
| | | ...
| | ...
| |-- [Model]
| | | ...
| | |-- [Algorithmic Model]
| | |-- [End Algorithmic Model]
| | | ...
| | ...
| | ...
|
| Figure 1: Partial keyword hierarchy
|
| GENERAL ASSUMPTIONS:
|
| This proposal breaks SERDES device modeling into two parts - electrical
| and algorithmic. The combination of the transmitter's analog back-end, the
| serial channel and the receiver's analog front-end are assumed to be linear
| and time invariant. There is no limitation that the equalization has to be
| linear and time invariant. The "analog" portion of the channel is
| characterized by means of an impulse response leveraging the pre-existing
| IBIS standard for device models.
|
| The transmitter equalization, receiver equalization and clock recovery
| circuits are assumed to have a high-impedance (electrically isolated)
| connection to the analog portion of the channel. This makes it possible to
| model these circuits based on a characterization of the analog channel.
| The behavior of these circuits is modeled algorithmically through the use
| of executable code provided by the SERDES vendor. This proposal defines the

Deleted: 1/19/2010

functions of the executable models, the methods for passing data to and from these executable models and how the executable models are called from the EDA platform.

The parameter definition file (.ami) is an ASCII file that the EDA tool reads. The DLL does not read the .ami file. The EDA tool uses the contents of the .ami file to:

- Specify flows that the model supports.
- Configures the model for specific silicon implementations.
- Configures the model for specific model programming.
- Tells the EDA tool how to analyze the model output.
- Tells the EDA tool what parameters are returned from the model.

AMI parameters are passed into the model and returned from the model using a parameter tree syntax. Please see section | 3.1.2.6 AMI parameters for a detailed description of the parameter tree syntax.

In this section, a sub-parameter is a leaf under a parameter that describes the Type, Usage, Allowed Values, and Description of the parameter.

A leaf is a parameter if the leaf only contains sub-parameters.

The .ami file is in essentially the same format as the string passed into and returned from the model except that in place of the parameter value, the .ami file contains sub-parameters.

The string passed into the model contains Usage In, and InOut parameters. The string passed back from the model contains Usage InOut and Out parameters.

Deleted: only

Deleted: only

A parameter tree contains a root, branches and leaves. The leaves of the parameter tree are AMI Parameters. Only leaves may have sub-parameters, except that the root and branches may have the sub-parameter Description.

AMI-Parameters can either be Reserved Parameters or Model Specific Parameter.

A branch may not contain two leaves or branches of the same name.

The root and branch names are case sensitive, and must start with a letter [a-Z], and may contain letters [a-Z], numbers [0-9], and underscore [_].

Parameter names are case sensitive, and must start with a letter [a-Z], and may contain letters [a-Z], numbers [0-9], and underscore [_], except tap parameter leaves which must be a positive integer, negative integer or zero. By convention reserved parameters will be a leaf off the root and start with a capital letter [A-Z]. It is highly recommended that two parameter names should not differ by case alone.

If a parameter has more than one sub-parameter, the order of the sub-parameters is unimportant.

If a branch contains two or more branches or leaves, the order of the branches and leaves is not important

The following sub-parameter names are not allowed parameter names.

- Type
- Usage
- Description

Environment Variables
Parameter values may reference a file name. These parameters must be of type String. If the string begins with a "$", then the string between the $ and the first / in the string shall be a computer system environment parameter that must be defined by the EDA tool. A special environment variable AMISearchPath shall contain a list of directories that the EDA tool shall search sequentially to find the file.

Environment Variables are used by the EDA tool or AMI check routine. All file names will be fully resolved by the EDA tool prior to them being passed to a DLL

Sub-Parameter Definitions

Usage: (Required)
In Parameter is required Input to executable
Out Parameter is Output only from executable
Info Information for user or EDA platform
InOut Required Input to executable. Executable may return a different value.

Type: (Required)
Float
Can be specified as an integer, decimal number, or in exponential format.
Integer
Can be positive, negative or zero.
String
Strings begin and end with a double quote (") and no double quotes are allowed inside the string literals. A null string is denoted by " " or "".
Carriage Return <CR> and Line Feed <LF> and End of Line <EOL> are explicitly allowed.

If a string references a file name, then there shall be no white space in the string and the Unix "/" shall delineate folders on all platforms including Windows.
Boolean
Values allowed are True and False.
Tap
The leaves of a branch represent Tx or Rx equalization coefficients. Values shall be Float
UI
Unit Interval, 1 UI is the inverse of the data rate frequency, for example 1 UI of a channel operating at 10 Gb/s is 100ps).
When the values of a parameter that is type UI is passed to the DLL or returned from the DLL, the value should be in UI, not seconds.

Deleted: not?

Deleted: There shall be no limit on the length of a String, or the number of lines in a String.

Deleted: 1/19/2010

Fangyi, 1/19

In the new AMI BIRD, if TxDCD is of Usage In and of type UI, should EDA tools convert it from UI to second when calling Tx Init, or we can assume the Tx DLL is expecting TxDCD in UI?
<WMK> This is also not clear in the Old BIRD either.

Bob, Does not want to introduce NA.

```
| Allowed_Values: (Required for Info, In and InOut) and has to be one of the following
  (default is NA?)  (NA not allowed for Info)  (Do we support NA?)
|     Value:     <value> Single value data
|                      <value>=NA implies there is no constraint on the <value>
|                      Example .ami           (Xyz (Value 5.))
|                      Example passed string  (Xyz 5.)
|     Range:     <typ> <min> <max>
|                      <typ> >= <min>
|                      <typ> <= <max>
|                      <min> = NA means there is no lower limit to a value
|                      <max> = NA means there is no upper limit to a value
|                      Example .ami           (Xyz (Range -1. -2. 4.)
|                      Example passed string  (Xyz 3.)
|     List:      <value1> <value2> <value3> ... <valueN>
|                      Example .ami           (Xyz (List 7 12 25 37 45))
|                      Example passed string  (Xyz 37.)
|     Labels:     <label1> < label2> < label3> ... < labelN>
|                 Only allowed (and optional) when a parameter has a List sub-parameter
|                      Example  (List Xslow Slow Typ Fast Xfast)
|                               (Lables "Extremely Slow Process" "Slow Process"
|                              "Typical Process"  "Fast Process" "Extremely Fast Process")
|     Corner:    <typ value> <slow value> <fast value>
|                      Example .ami           (Xyz (Corner 0 -1 1)0
|                      Example passed string  (Xyz 1)

|     Increment: <typ> <min> <max> <delta>
|                      <typ> >= <min>
|                      <typ> <= <max>
|                      <min> = NA means there is no lower limit to a value
|                      <max> = NA means there is no upper limit to a value
|                The allowed values of the parameter are
|                typ+N*delta where N is any positive or negative integer
|                value such that:  min <= typ + N*delta <= max
|                      Example .ami           (Xyz (Increment 50 NA 100 50))
|                      Example passed string  (Xyz 55)
|     Steps:      <typ> <min> <max> <# steps>
|                      <typ> >= <min>
|                      <typ> <= <max>
|                Treat exactly like Increment with
|                <delta> == (<max>-<min>)/<# steps>
|                      Example  (Steps 50 0 100 20)
|                      Example .ami           (Xyz (Steps 50 0 100 20))
|                      Example passed string  (Xyz 55)
```

Deleted: 1/19/2010

|
| Default <value>: (Optional)
| Depending on the Type, <value> will provide a default value for the
| parameter. For example, if the Type is Boolean, <value> could be True
| or False, if the Type is Integer, the <value> can be an integer value.
| Default is ignored if Allowed-Value is Corner.
| If Default is not specified, then the default value of a parameter shall depend
| on the Allowed-Value. If Default is specified then it must be a legal Allowed-Value.
| Value: <value>
| Range: <typ>
| List: <value1>
| Label: NA
| Corner: NA
| Increment: <typ>
| Steps: <typ>

|
| Description <string>: (Optional, Highly recommended for Model Specific)
| ASCII string following Description describes a reserved parameter,
| model specific parameter, a branch within the parameter tree
| or the Algorithmic model itself. It is used
| by the model make to convey information to the EDA platform and for the EDA platform
| to convey information to the end-user.
| There shall be no limit on the length of a Description, or the number of lines
| in a Description, however, the model developer should assume that the first
| IBIS line length limit (currently 128 characters) of the first line be at minimum
| an abstract of the full description.
| The location of Description will determine whether to description applies to a parameter,
| branch or model. (Multiple instances of Description for one parameter?)
|
|
| Every (not Usage Out) parameter must have one, and only one of the following
| "Allowed-Value" sub-parameters:
| Value
| Range
| List
| Corner
| Increment
| Steps
|
| Note that in the context of Algorithmic Model for type 'Corner', <slow
| value> and <fast value> align implicitly to slow and fast corners, and
| <slow value> does not have to be less than <fast value>. For type 'Range'
| and 'Increment', <min value>, <max value> does not imply slow and fast
| corners.
|
| If a Reserved Parameter must have one and only one Usage, Usage is optional.
| If a Reserved Parameter must have one and only one Type, Type is optional.
|
| Notes:
| 1. Throughout the section, text strings inside the symbols "<" and ">"
| should be considered to be supplied or substituted by the model maker.
| Text strings inside "<" and ">" are not reserved and can be replaced.
| 2. Throughout the document, terms "long", "double" etc. are used to
| indicate the data types in the C programming language as published in
| ISO/IEC 9899-1999.

Deleted: The entire¶
| line has to be limited to IBIS line length specification.

Deleted:

Deleted: 1/19/2010

```
| 3. Throughout the section, text strings inside the symbols "[(" and ")]"
| indicate that the parameter definition is optional.
| 4. Previous versions of the AMI spec used the two-word keyword sequence Format
| along with the Allowed-Value keyword. These AMI files can be corrected for the
| new format by simply removing the keyword Format from the AMI file. No change to
| the DLL is required. These AMI files can be parsed for the new format by simply
| ignoring the keyword Format from the AMI file.
| 5. Previous versions of the AMI spec required all parameter be either in a
| Reserved Parameter branch, or a Model Specific branch. These AMI files can be
| corrected for the new format by simply removing the Reserved Parameter branch and
| Model Specific branch from the AMI file, thus moving all parameter definition to
| the root branch of the parameter tree. No change to the DLL is required. These
| AMI files can be parsed for the new format by simply moving all parameters in the
| the Reserved Parameter branch and Model Specific branch into the root branch of the
| tree.
|
```

IBIS-AMI Conventions

In

Parameters defined as **Usage In** are presented to the user in the EDA tool solution space if the user can control them, then formatted and presented to the algorithmic model as part of the AMI_Init call. The EDA tool does **NOT** perform any special processing on parameters defined as **Usage In**. A parameter defined as **Usage In** cannot affect the results of Network Characterization, but may affect the results of both Statistical and Time Domain simulation by changing the model's output.

InOut

Parameters defined as **Usage InOut** are presented to the user in the EDA solution space if the user can control them, then formatted and presented to the algorithmic model as part of the AMI_Init call. The model may also report values for this parameter via the AMI Parameters_Out interface. The EDA tool may simply report the data output by the model or may use it to perform additional processing, based on the specific parameter in question. A parameter defined as **Usage InOut** cannot affect the results of Network Characterization, but may affect the results of both Statistical and Time Domain simulation, either by changing the model's output or by affecting additional processing.

Out

The algorithmic model may report values for parameters defined as **Usage Out** via the AMI Parameters_Out interface. The EDA tool may simply report the data output by the model or may use it to perform additional processing, based on the specific parameter in question. A parameter defined as **Usage Out** cannot affect the results of Network Characterization, but may affect the results of both Statistical and Time Domain simulation, either by changing the model's output or by affecting additional processing.

Info

Parameters defined as **Usage Info** are presented to the user in the EDA solution space if the user can control them and are used only by the simulator. These parameters may control the analysis flow, supply additional data that gets factored into the analysis or control other aspects of the analysis. Parameters defined as **Usage Info** are **NEVER** presented to algorithmic models via the AMI_Init call. A parameter defined as **Usage Info** can affect the results of Network Characterization, Statistical and Time Domain simulation.

Deleted: 1/19/2010

```
|=============================================================================
|
| KEYWORD DEFINITIONS:
|
|=============================================================================
|    Keywords: [Algorithmic Model], [End Algorithmic Model]
|    Required: No
|
| Description: Used to reference an external compiled model.  This compiled
|              model encapsulates signal processing functions.  In the case
|              of a receiver it may additionally include clock and data
|              recovery functions.  The compiled model can receive and modify
|              waveforms with the analog channel, where the analog channel
|              consists of the transmitter output stage, the transmission
|              channel itself and the receiver input stage.  This data
|              exchange is implemented through a set of software functions.
|              The signature of these functions is elaborated in section 10
|              of this document.  The function interface must comply with
|              ANSI 'C' language.
|
|  Sub-Params: Executable
| Usage Rules: The [Algorithmic Model] keyword must be positioned within a
|              [Model] section and it may appear only once for each [Model]
|              keyword in a .ibs file.  It is not permitted under the
|              [Submodel] keyword.
|
|              The [Algorithmic Model] always processes a single waveform
|              regardless whether the model is single ended or differential.
|              When the model is differential the waveform passed to the
|              [Algorithmic Model] must be a difference waveform.
|
|              [Algorithmic Model], [End Algorithmic Model]
|              Begins and ends an Algorithmic Model section, respectively.
|
|
|              Subparameter Definitions:
|
|              Executable:
|
|              Three entries follow the Executable subparameter on each line:
|
|                Platform_Compiler_Bits  File_Name  Parameter_File
|
|              The Platform_Compiler_Bits entry provides the name of the
|              operating system, compiler and its version and the number of
|              bits the shared object library is compiled for.  It is a
|              string without white spaces, consisting of three fields
|              separated by an underscore '_'.  The first field consists of
|              the name of the operating system followed optionally by its
|              version.  The second field consists of the name of the
|              compiler followed by optionally by its version.  The third
|              field is an integer indicating the platform architecture.  If
|              the version for either the operating system or the compiler
|              contains an underscore, it must be converted to a hyphen '-'.
|              This is so that an underscore is only present as a separation
|              character in the entry.
|
```

Deleted: 1/19/2010

The architecture entry can be either "32" or "64". Examples of Platform_Compiler_Bits:

```
Linux_gcc3.2.3_32
Solaris5.10_gcc4.1.1_64
Solaris_cc5.7_32
Windows_VisualStudio7.1.3088_32
HP-UX_accA.03.52_32
```

The EDA tool will check for the compiler information and verify if the shared object library is compatible with the operating system and platform.

Multiple occurrences, without duplication, of Executable are permitted to allow for providing shared object libraries for as many combinations of operating system platforms and compilers for the same algorithmic model.

The File_Name provides the name of the shared library file. The shared object library can be in the same directory as the IBIS (.ibs) file, or in directories defined in an environment variable AMISearchPath.

Deleted: should

The Parameter_File entry provides the name of the parameter file with an extension of .ami. This must be an external file and should reside in the same directory as the .ibs file and the shared object library file. It will consist of reserved and model specific (user defined) parameters for use by the EDA tool and for passing parameter values to the model. If there are multiple Executable lines in a [Algorithmic Model] they all must have the same Parameter File name.

The model parameter file must be organized in the parameter tree format as discussed in section 3.1.2.6 of "NOTES ON ALGORITHMIC MODELING INTERFACE AND PROGRAMMING GUIDE", Section 10 of this document.

The Model Parameter File must be organized in the following way:

```
(<my_AMIname>            | Name given to the Parameter file
                         | (This need not be the same as the basename
                         | of the .ami file)

    (Parameter Text)
  ...

  (Description <string>) | description of the model
                         | (optional)
)                        | End my_AMIname parameter file
```

Deleted:

Reserved Parameters:

AMI_Version	(Required)
Init_Returns_Impulse	(Required)
GetWave_Exists	(Required)

Deleted: 1/19/2010

```
|                   Max_Init_Aggressors      (Optional)
|                   Ignore_Bits              (Optional)
|                   Use_Init_Output          (Optional)
|                   Init_Returns_Filter      (Optional)
|                   Tx_Dj                    (Tx only, Optional)
|                   Tx_Rj                    (Tx only, Optional)
|                   Tx_DCD                   (Tx only, Optional)
|                   Rx_Clock_Recovery_Mean   (Rx only, Optional)
|                   Rx_Clock_Recovery_Rj     (Rx only, Optional)
|                   Rx_Receiver_Sensitivity  (Rx only, Optional)
```

Bob, (Require AMI_Version?)

```
|
|
|               All reserved parameters must contain sub-parameters Usage, Type,
|               and one of the Allowed-Values sub-parameters. Description is optional.
```

Fangyi "All reserved parameters must contain sub-parameters Usage, Type, and one of the Allowed-Values sub-parameters." is contradictory to statement "If a Reserved Parameter must have one and only one Usage, Usage is optional. If a Reserved Parameter must have one and only one Type, Type is optional." on page 7 and some examples.

```
|
|               AMI_Version:
|
|               AMI_Version is of usage Info, type Float, and Value 5.1.
|               Example of AMI_Version declaration is:
|                  (AMI_Version (Usage Info)(Type Float) (Value 5.1))
|
|               Init_Returns_Impulse:
|
|               Init_Returns_Impulse is of usage Info and type Boolean.  It
|               tells the EDA platform whether the AMI_Init function returns
|               a modified impulse response.  Allowed-Values must be Value.
|               When this value is set to True, the model returns either the impulse
|               response of the filter, or the impulse response of the channel including
|               the equalization of the filter depending on the value of Init_Returns_Filter.
|               If GetWave_Exists is False, AMI_Init always returns a modified impulse response.
|               If GetWave_Exists is True, the model writer may set
|               Init_Returns_Impulse to False, and not return an impulse response. It is
|               highly recommended that Tx models that have GetWave_Exists set to True
|               also have Init_Returns_Impulse set to True and return a best estimate
|               modified impulse response in order to maximize the effectiveness of
|               Rx Ami_Init function that do internal optimization based on the channel and
|               Tx equalization.
|
|               Example of Init_Returns_Impulse declaration is:
|                  (Init_Returns_Impulse (Usage Info)(Type Boolean) (Value True))
|
|               GetWave_Exists:
|
|               GetWave_Exists is of usage Info and type Boolean.  It tells
|               the EDA platform whether the "AMI_GetWave" function is
|               implemented in this model.  Allowed-Value must be Value.
|               Note that if Init_Returns_Impulse
```

Deleted: 1/19/2010

is set to "False", then Getwave_Exists MUST be set to "True".
Examples of GetWave_Exists declaration are:
(GetWave_Exists (Usage Info)(Type Boolean) (Value True))
(GetWave_Exists (Value True))

Use_Init_Output:

Use_Init_Output is of usage Info and type Boolean. It
tells the EDA platform if it needs to combine the output of
AMI_Init with the waveform. If the model AMI_GetWave is False
the value of Use_Init_Ouput parameter must be True.
If Use_Init_Output=True in a Tx model with an AMI_GetWave, then the
output of the Tx AMI_GetWave needs to be convolved with the output of Tx
AMI_Init, instead of convolved with the impulse response of the channel
alone. If Use_Init_Output=True in a Tx model without an AMI_GetWave, then the
output of the Tx stimulus waveform must be convolved with an impulse response
that contains both the channel and the output of AMI_INIT.
AMI_GetWave needs to be convolved with the output of Tx
AMI_Init, instead of convolved with the impulse response of the channel
alone._Use_Init_Output=True in an Rx model with an AMI_GetWave, then the
input to the Rx AMI_GetWave needs to be convolved with the filter only
component of the output of Rx AMI_Init. If Use_Init_Output is not
specified in the .ami file then it is assumed to be False.
Allowed-Values must be Value.
Examples of Use_Init_Output declaration is:
(Use_Init_Output (Usage Info)(Type Boolean) (Value True))
(Use_Init_Output (Value False))

Init_Returns_Filter:
(WMK, although most often the EDA tool will use the combination of the impulse response input to AMI_Init and the response of the filter block within the model, there are flows in which the EDA tool needs to use the impulse response of just the filter. To avoid the EDA tool from doing a deconvolution, it is advisable that the AMI_Init function have the ability to return either the impulse of just the filter, or the combination of the filter and the input impulse response.)

Kumar, How does this combination prevents deconvolution/other techniques to derive the filter response?)

Init_Returns_Filter is of usage Info and type Boolean. If it is True, then
The AMI_Init function will return just the impulse response of the filter.
If not set, or is False, AMI_Init will return only the impulse response
of the filter convolved with the channel.
Examples of Init_Returns_Filter declaration are:
(Init_Returns_Filter (Usage Info)(Type Boolean) (Value False))
(Init_Returns_Filter (Value True))

Max_Init_Aggressors:

Max_Init_Aggressors is of usage Info and type Integer.
Allowed-Values must be Value. It Tells the EDA platform how many aggressor
Impulse Responses the AMI_Init function is capable of processing.
Example of Max_Init_Aggressors declaration is:

Deleted: |

Deleted: ¶

Deleted: 1/19/2010

(Max_Init_Aggressors (Usage Info)(Type Integer) (Value 25))

Ignore_Bits:

Ignore_Bits is of usage Info and type Float or , Allowed-Value must be Value. It tells the EDA platform how long the time variant model takes to complete initialization. This parameter is meant for AMI_GetWave functions that model how equalization adapts to the input stream. The value in this field tells the EDA platform how many bits of the AMI_Getwave output should be ignored. Examples of Ignore_Bits declaration are:

(Ignore_Bits (Usage Info)(Type Integer) (Value 100))
(Ignore_Bits (Usage Info)(Type Float) (Value 1.e5))

Tx_Dj:

Tx_Dj (Transmit Deterministic Jitter) can be of Usage Info, In or Out, of Type Float or UI and of Allowed-Value Value, Range and Corner. Tx_Dj is the deterministic jitter of the transmit clock. If the Usage is In, then the EDA tool can assume that Tx_Dj will be implemented in the Tx AMI_GetWave funtion. If of type Float, then its units are in seconds. Example of Tx_Dj declaration is:

(Tx_Dj (Usage In)(Type UI) (Value .1))

Tx_Rj:

Tx_Rj (Transmit Random Jitter) can be of Usage Info, In or Out, of Type Float or UI and of Allowed-Value Value, Range and Corner. Tx_Rj is the random jitter of the transmit clock. If the Usage is In, then the EDA tool can assume that Tx_Rj will be implemented in the Tx AMI_GetWave funtion. If of type Float, then its units are in seconds. Example of Tx_Rj declaration is:

(Tx_Rj (Usage Info)(Type UI) (Value .05))

Sj, Pj, …

Tx_DCD:

Tx_DCD (Transmit Duty Cycle Distortion) can be of Usage Info, In or Out. It can be of Type Float and UI and can have Allowed-Value of Value, Range and Corner. It tells the EDA platform the maximum percentage deviation of the duration of a transmitted pulse from the nominal pulse width. If the Usage is In, then the EDA tool can assume that Tx_DCD will be implemented in the Tx AMI_GetWave funtion. If of type Float, then its units are in seconds. Example of Tx_DCD declaration is:

(Tx_DCD (Usage Info)(Type UI) (Value .15))

|
| Rx_Clock_Recovery_Mean can be of Usage_Info, In or Out, of
| Type Float or UI and of Allowed-Value Value, Range and Corner.
| Rx_Clock_Recovery_Mean is the offset of the recovered clock from
| the center of an average bit. If the Usage is In, then the EDA tool
| can assume that Rx_Clock_Recovery_Mean will be implemented in the
| Rx_AMI_GetWave funtion. If of type Float, then its units are in seconds.
| Example of Rx_Clock_Recovery_Mean declaration is:
| (Rx_Clock_Recovery_Mean (Usage_Info)(Type UI) (Value .15))
|

Fangyi.. 1/11

If its Usage is In, signal is sampled at 0.5*bit_time after a clock time as stated on page 29 in the BIRD.

If its Usage is Info or Out, signal is sampled at (0.5*bit_time + Rx_Clock_Recovery_Mean) after a clock time.

WMK

If Rx_Clock_Recovery_Mean is Info or Out, it is used by the EDA tool to predict BIT Error rate in statistical analysis, or in time domain analysis if Rx GetWave does not return clock ticks.

If Rx_Clock_Recovery_Mean is In, then is it is used by Rx GetWave to generate clock ticks.

| Rx_Clock_Recovery_Rj:
|
| Rx_Clock_Recovery_Rj can be of Usage_Info, In and Out, of
| Type Float or UI and of Allowed-Value Value, Range and Corner.
| Rx_Clock_Recovery_Rj is sigma of the Gaussian distribution of
| the recovered clock around the clock mean. If the Usage is In, then
| the EDA tool can assume that Rx_Clock_Recovery_Rj will be implemented in the
| Rx_AMI_GetWave funtion. If of type Float, then its units are in seconds.
| Example of Rx_Clock_Recovery_Rj declaration is:
| (Rx_Clock_Recovery_Rj (Usage_Info)(Type UI) (Value .05))
|
| Rx_Receiver_Sensitivity:
|
| Rx_Receiver_Sensitivity can be of Usage_Info, In, or Out and of
| Type Float and of Allowed-Value Value, Range and Corner.
| Rx_Receiver_Sensitivity is the voltage
| needed at the receiver data decision point to ensure proper
| sampling of the equalized signal. In this example, 100 mV
| (above +100 mV or below -100 mV) is needed to ensure the
| signal is sampled correctly. Units are in Volts.

Kumar, How the EDA/model is expected to use this information in a standard way during simulation/post processing?

As an Info, In, or Out, the EDA tool will declare the value of a bit as 1 if the waveform value is >= Rx_Receiver_Sensitivity or 0 if the waveform value is <= -Rx_Receiver_Sensitivity. The EDA tool will declare the value unknown otherwise. The DLL can use the value of Rx_Receiver_Sensitiviy in any way it chooses to.

| Example of Rx_Receiver_Sensitivity declaration is:
| (Rx_Receiver_Sensitivity (Usage_Info)(Type Float) (Value .1))
|

Model Specific Parameters:

The Following section describes the user-defined parameters.
The algorithmic model expects these parameters and their
values to function appropriately. The model maker can specify
any number of user defined parameters for their model.

The user defined parameters must be in the following format:

(<parameter_name> (usage <usage>) (Type <data type>)
(Allowed Values)) [(Default <values>)]
(Description <string>))

A tapped delay line can be described by creating a separate
parameter for each tap weight and grouping all the tap
weights for a given tapped delay line in a single parameter
group which is given the name of the tapped delay line. If in
addition the individual tap weights are each given a name
which is their tap number (i.e., "-1" is the name of the
first precursor tap, "0" is the name of the main tap, "1" is
the name of the first postcursor tap, etc.) and the tap
weights are declared to be of type Tap, then the EDA platform
can assume that the individual parameters are tap weights in
a tapped delay line, and use that assumption to perform tasks
such as optimization. The model developer is responsible for
choosing whether or not to follow this convention.

The type Tap implies that the parameter takes on floating
point values. Note that if the type Tap is used and the
parameter name is not a number (except for Limit and Scale
, this is an error condition
for which EDA platform behavior is not specified.

Tap parameter names Limit and Scale are used to adjust Tap values.
A Tap may have a Scale, a Limit, or neither. If Scale is specified
then the sum of the absolute values of all of the Taps must equal Scale.
If Limit is specified then the Taps are scaled by
Limit/(maximum value of the absolute values of all of the Taps).
Scale and Limit must be Usage Info, Type Tap, and Allowed-Value Value)

Array
If a branch has multiple leaves, and one of the leafs is Array, and the value of
Array is True, then the parameter tree that is passed into the model, and returned
from the model will use the branch as the parameter name, and the values of all of the leaves
of the branch (except the Array, Scale, and Limit leaves) will be passed as a white space
delimited string.

Fangyi should the order of array values in the parameter string follows the order of the leaves
appear in the branch? If yes, how does the ibis parser make sure such order information is passed
to EDA tools?

The order of the vlues of the leaves shall be in the order of increasing tap number.

| 1 OVERVIEW
| ==========
|
```

Deleted: 1/19/2010

The algorithmic model of a Serializer-Deserializer (SERDES) transmitter or receiver consists of three functions: 'AMI_Init', 'AMI_GetWave' and 'AMI_Close'. The interfaces to these functions are designed to support three different phases of the simulation process: initialization, simulation of a segment of time, and termination of the simulation.

These functions ('AMI_Init', 'AMI_GetWave' and 'AMI_Close') should all be supplied in a single shared library, and their names and signatures must be as described in this section. If they are not supplied in the shared library named by the Executable sub-parameter, then they shall be ignored. This is acceptable so long as

1. The entire functionality of the model is supplied in the shared library.
2. All termination actions required by the model are included in the shared library.

The three functions can be included in the shared object library in one of the two following combinations:

Case 1: Shared library has AMI_Init, AMI_Getwave and AMI_Close.
Case 2: shared library has AMI_Init and AMI_Close.
Case 3: Shared library has only AMI_Init.

Please note that the function 'AMI_Init' is always required.

The interfaces to these functions are defined from three different perspectives. In addition to specifying the signature of the functions to provide a software coding perspective, anticipated application scenarios provide a functional and dynamic execution perspective, and a specification of the software infrastructure provides a software architecture perspective. Each of these perspectives is required to obtain interoperable software models.

2 APPLICATION SCENARIOS

Arpad to rewrite this section.

3 FUNCTION SIGNATURES

3.1 AMI_Init

3.1.1 Declaration

```
long AMI_Init (double *impulse_matrix,
               long row_size,
               long aggressors,
```

Deleted: 2.1 Linear, Time-invariant Equalization Model

1. From the system netlist, the EDA platform determines that a given [Model] is described by an IBIS file.

2. From the IBIS file, the EDA platform determines that the [Model] is described at least in part by an algorithmic model, and that the AMI_Init function of that model returns an impulse response for that [Model].

3. The EDA platform loads the shared library containing the algorithmic model, and obtains the addresses of the AMI_Init, AMI_GetWave, and AMI_Close functions.

4. The EDA platform assembles the arguments for AMI_Init. These arguments include the impulse response of the channel driving the [Model], a handle for the dynamic memory used by the [Model], the parameters for configuring the [Model], and optionally the impulse responses of any crosstalk interferers.

5. The EDA platform calls AMI_Init with the arguments previously prepared.

6. AMI_Init parses the configuration parameters, allocates dynamic memory, places the address of the start of the dynamic memory in the memory handle, computes the impulse response for the [Model] and passes it back to the EDA platform.

7. The EDA platform completes the rest of the simulation/analysis using the impulse response from AMI_Init as a complete representation of the ... [3]

|                char **AMI_parameters_out,
|                void **AMI_memory_handle,
|                char **msg)
|
| 3.1.2 Arguments
| ===============
|
| 3.1.2.1 impulse_matrix
| ======================
|
| Impulse matrix is the channel impulse response matrix.  The impulse values
| are in Volts and are uniformly spaced in time.  The sample spacing is given
| by the parameter 'sample_interval'.
```

Deleted: v

Fangyi, Volts or Volt/sec? (I believe Volts is correct.

```
|
| AMI_Init should be written to support a null **AMI_memory_handle. In this case,
| the AMI_Init will ignore any data, if any, in *impulse_matrix and will still return
| **AMI_parameters_out, and **msg. If **AMI_memory_handle is null then AM_Close will
| still need to be called before the next call to AMI_Init. The intent of this entry
| is to allow the model developer to implement computational expressions to recalculate
| AMI_parameters base on the selected value of other AMI_parameters. (WMK: I suspect we
| will need a new Reserved Parameter Computational Entry that tells the EDA
| tool that AMI_Init has this computational capability.)
```

(WMK) It has been suggested that instead of a null **AMI_memory_handle, this entry be indicated by aggressors being -1. Detail TBD.

Kumar, it is proposed that with null memory handle, the model still can return **msg and **AMI_parameters_out. The present standard says this memory is owned by the model. Is that still correct?

Yes.

```
|
| The 'impulse_matrix' is stored in a single dimensional array of floating
| point numbers which is formed by concatenating the columns of the impulse
| response matrix, starting with the first column and ending with the last
| column.  The matrix elements can be retrieved /identified using
|
|   impulse_matrix[idx] = element (row, col)
|   idx = col * number_of_rows + row
|   row - row index , ranges from 0 to row_size-1
|   col - column index, ranges from 0 to aggressors
|
| The first column of the impulse matrix is the impulse response for the
| primary channel.  The rest are the impulse responses from aggressor drivers
| to the victim receiver.
|
| The impulse response of a short lossless channel is a rectangle with a
| width equal to sample_interval (in other words, one discrete sample) and
```

Deleted: 1/19/2010

| a height of 1/sample_interval (to get the unit area).
| The impulse response of a short lossless channel would be element[0,0]=
| 1/sample_interval, element[n,0] = 0 for all n != 0. If the channel was lossless
| but had a length of 30.3 sample_intervals, then element[30,0]=.667/sample_interval,
| element[31,0]=.333/sample_interval, element[n] = 0 for all n != 30 and 31.
|
| The AMI_Init function may return a modified impulse response by modifying
| the first column of impulse_matrix. If the impulse response is modified,
| the new impulse response is expected to represent the concatenation of the
| model block with the blocks represented by the input impulse response
| if Init_Returns_Filter is False, or is not specified. If Init_Returns_Filter is True
| the AMI_Init function will return an impulse response of the model block only.
|
| The aggressor columns of the matrix should not be modified.
|
| 3.1.2.2 row_size
| ================
|
| The number of rows in the impulse matrix.
|
| 3.1.2.3 aggressors
| ==================
|
| The number of aggressors in the impulse matrix.
|
| 3.1.2.4 sample_interval:
| ========================
|
| This is the sampling interval of the impulse matrix. Sample_interval is
| usually a fraction of the highest data rate (lowest bit_time) of the
| device. Example:
|
| Sample_interval = (lowest_bit_time/64)
|
| 3.1.2.5 bit_time
| ================
|
| The bit time or unit interval (UI) of the current data, e.g., 100 ps, 200
| ps etc. The shared library may use this information along with the impulse
| matrix to initialize the filter coefficients.
|

| 3.1.2.6 AMI_parameters (_in and _out)
| ====================================
|
| Memory for AMI_parameters_in is allocated and de-allocated by the EDA platform. The
| memory pointed to by AMI_parameters_out is allocated and de-allocated by the model.
| This is a pointer to a string. All the input from the IBIS AMI parameter
| file are passed using a string that been formatted as a parameter tree.
|
| Examples of the tree parameter passing is:
|
| (dll
| (tx
| (taps 4)
| (spacing sync)
|)
|)
|
| and
|
| (root
| (branch1
| (leaf1 value1)
| (leaf2 value2)
| (branch2
| (leaf3 value3)
| (leaf4 value4)
|)
| (leaf5 value5 value6 value7)
|)
|)
|
| http://en.wikipedia.org/wiki/Leaf_object
| Tree structure Definitions
| A leaf node of a tree structure has zero child nodes
| A non-leaf node is called a branch node
| The root node has no parent
| Leaf nodes are AMI Parameters
|
| Note that the only way a parameter can pass more than one value is if the
| parameter is a branch with the sub-parameter Array True.
|
| The syntax for this string is:
|
| 1. Neither names nor individual values can contain white space characters.
| White space (only blank and tab) is allowed between a pair of double quotes
| delimiting a string.
| 2. Parameter name/value pairs are always enclosed in parentheses, with the
| value separated from the name by white space.
| 3. A parameter value in a name/value pair can be either a single value or a
| list of values separated by whitespace.
| 4. Parameter name/value pairs can be grouped together into parameter groups
| by starting with an open parenthesis followed by the group name followed
| by the concatenation of one or more name/value pairs followed by a close
| parenthesis.
| 5. Parameter name/values pairs and parameter groups can be freely
| intermixed inside a parameter group.

Deleted: | Memory for AMI_parameters_in is allocated and de-allocate by the EDA. The¶
| memory pointed to by AMI_parameters_out is allocated and by the model.

Field Code Changed

Deleted: 1/19/2010

| 6. The top level parameter string must be a parameter group.
| 7. White space is ignored, except as a delimiter between the parameter name
| and value.
| 8. Parameter values can be expressed either as a string literal, boolean, integer
| number (e.g. 50) or floating point number in the standard ANCI 'C' notation
| (e.g., 2.0e-9). String literal values are delimited using a double
| quote (") and no double quotes are allowed inside the string literals.
| White space (only blank and tab) is allowed between a pair of double quotes
| delimiting a string.
| 9. A parameter can be assigned an array of values by enclosing the
| parameter name and the array of values inside a single set of
| parentheses, with the parameter name and the individual values all
| separated by white space.
|
| The modified BNF specification for the syntax is:
|
| <tree>:
| <branch>
|
| <branch>:
| (<branch name> <leaf list>)
|
| <leaf list>:
| <branch>
| <leaf>
| <leaf list> <branch>
| <leaf list> <leaf>
|
| <leaf>:
| (<parameter name> whitespace <value list>)
|
| <value list>:
| <value>
| <value list> whitespace <value>
| <value>:
| <string literals>
| <decimal number>
| <decimal number>e<exponent>
| <decimal number>E<exponent>
|

Deleted: decimal

Deleted: for floating point numbers

| ============
|
| An array of a time domain waveform, sampled uniformly at an interval
| specified by the 'sample_interval' specified during the init call. The
| wave is both input and output. The EDA platform provides the wave.
| The algorithmic model is expected to modify the waveform in place by
| applying a filtering behavior, for example, an equalization function,
| being modeled in the AMI Getwave call.
|
| Depending on the EDA platform and the analysis/simulation method chosen,
| the input waveform could include many components. For example, the input
| waveform could include:
|

Deleted: | A vector of a time domain waveform, sampled uniformly at an interval¶ | specified by the 'sample_interval' specified during the init call. The¶ | wave is both input and output. The EDA platform provides the wave. The¶ | algorithmic model is expected to modify the waveform in place.

Deleted: 1/19/2010

| - The waveform for the primary channel only.
| - The waveform for the primary channel plus crosstalk and amplitude noise.
| - The output of a time domain circuit simulator such as SPICE.
|
| It is assumed that the electrical interface to either the driver or the
| receiver is differential. Therefore, the sample values are assumed to be
| differential voltages centered nominally around zero volts. The
| algorithmic model's logic threshold may be non-zero, for example to model
| the differential offset of a receiver; however that offset will usually be
| small compared to the input or output differential voltage.
|
| The output waveform is expected to be the waveform at the decision point of
| the receiver (that is, the point in the receiver where the choice is made
| as to whether the data bit is a "1" or a "0"). It is understood that for
| some receiver architectures, there is no one circuit node which is the
| decision point for the receiver. In such a case, the output waveform is
| expected to be the equivalent waveform that would exist at such a node
| were it to exist.

|   Return 1;
|
|*****************************************************************************

ANALYSIS PATH/DATA THAT LED TO SPECIFICATION:

This section of the IBIS specification has been driven primarily by the
following factors:

1. The interaction between a SERDES and the system surrounding it is quite
complex, thus requiring sophisticated and detailed modeling.

2. There is considerable variation in the architectures and circuit
```

Deleted: vector

Deleted: 1/19/2010

techniques used in SERDES devices.

3. There is not a commonly accepted set of parameters that can be measured to fully and reliably characterize the performance of a given SERDES device independently from the system that surrounds it.

Because of these factors, IP vendors' experience has been that customers use the models delivered by the IP vendor as a form of performance specification. If the model predicts a level of performance in a given application, then the IP is held to that level of performance or better when the system is tested.

For this reason, IP vendors are reluctant to supply any but most detailed and accurate models they can produce. This is a fundamental shift in that in the past, the models that were presumed to be utterly complete and reliable were SPICE models, and IBIS models were understood to be a useful approximation that could be shared without divulging sensitive proprietary information.

By setting the algorithmic model as the primary deliverable, this specification maximizes the flexibility available to the model developers and also maximizes the degree of protection for proprietary information. By standardizing the interface to these algorithmic models, this specification also enables the required degree of interoperability.

Linear, Time-invariant Equalization Model

. From the system netlist, the EDA platform determines that a [Model] is described by an IBIS file.

. From the IBIS file, the EDA platform determines that the [Model] described at least in part by an algorithmic model, and that the AMI_Init function of that model returns an impulse response for [Model].

. The EDA platform loads the shared library containing the ithmic model, and obtains the addresses of the AMI_Init, AMI_GetWave, AMI_Close functions.

. The EDA platform assembles the arguments for AMI_Init. These ents include the impulse response of the channel driving the [Model], handle for the dynamic memory used by the [Model], the eters for configuring the [Model], and optionally the impulse responses of crosstalk interferers.

. The EDA platform calls AMI_Init with the arguments previously red.

. AMI_Init parses the configuration parameters, allocates dynamic y, places the address of the start of the dynamic memory in the y handle, computes the impulse response for the [Model] and passes back to the EDA platform.

. The EDA platform completes the rest of the simulation/analysis the impulse response from AMI_Init as a complete representation e behavior of the given [Model].

. Before exiting, the EDA platform calls AMI_Close, giving it the ss in the memory handle for the [Model].

. AMI_Close de-allocates the dynamic memory for the block and
rms
  whatever other clean-up actions are required.

. The EDA platform terminates execution.

Nonlinear, and / or Time-variant Equalization Model

From the system netlist, the EDA platform determines that a given

is described by an IBIS file.

From the IBIS file, the EDA platform determines that the block is
described at least in part by an algorithmic model.

The EDA platform loads the shared library or shared object file
containing the algorithmic model, and obtains the addresses of

AMI_Init, AMI_GetWave, and AMI_Close functions.

The EDA platform assembles the arguments for AMI_Init. These
ents
include the impulse response of the channel driving the block, a
e
for the dynamic memory used by the block, the parameters for
configuring the block, and optionally the impulse responses of

crosstalk interferers.

The EDA platform calls AMI_Init with the arguments previously
red.

AMI_Init parses the configuration parameters, allocates dynamic
y
and places the address of the start of the dynamic memory in the
y
handle. AMI_Init may also compute the impulse response of the

and pass the modified impulse response to the EDA tool.

A long time simulation may be broken up into multiple time
nts.
For each time segment, the EDA platform computes the input
orm to
the [Model] for that time segment. For example, if a million
are
to be run, there can be 1000 segments of 1000 bits each, i.e. one

segment comprises 1000 bits.

For each time segment, the EDA platform calls the AMI_GetWave
ion,
giving it the input waveform and the address in the dynamic
y

handle for the block.

The AMI_GetWave function computes the output waveform for the
. In
the case of a transmitter, this is the Input voltage to the
ver.
In the case of the receiver, this is the voltage waveform at the
decision point of the receiver.

The EDA platform uses the output of the receiver AMI_GetWave
ion
to complete the simulation/analysis. For transmitter, it simply
s
the output to the receiver AMI_GetWave.

Before exiting, the EDA platform calls AMI_Close, giving it the
ss
in the memory handle for the block.

AMI_Close de-allocates the dynamic memory for the block and
rms
whatever other clean-up actions are required.

The EDA platform terminates execution.
