

IBIS Quality Control Through Scripting

Justin Butterfield

DAC IBIS Summit

San Francisco, CA, USA

June 5, 2012

Outline

- ▶ Motivations
- ▶ Scripts to automate IBIS generation
 - Building an IBIS template
 - Importing table data into the template
 - Formatting package RLC data
- ▶ Script for checking IBIS parameters
- ▶ Scripts for EBDs
 - EBD generation
 - EBD connectivity report

Why Use Scripts for Quality Control

- ▶ IBIS files can be very large and complex
- ▶ Micron 2Gb DDR3 SDRAM IBIS model statistics:
 - 154 [Model]s, 20 [Submodel]s, 40+ parameters per [Model]
- ▶ Large number of [Model]s due to combinations of features
 - Including: Drive strength, ODT, Speed Grade (Vinl/Vinh levels & Overshoot)
 - Most [Model]s only vary a few parameters
- ▶ Prone to copy and paste errors and typos
 - Incorrect Vinl/Vinh, Overshoot, and C_comp values
 - Incorrect table data and Submodel mapping
- ▶ ibischk does not check accuracy!

IBIS Generation Flow

- ▶ Build an IBIS template
- ▶ Generate table data (I-V, V-t, Ramp, etc.)
- ▶ Import table data into IBIS template
- ▶ Format and add package models
- ▶ Check IBIS file
- ▶ Generate EBD files
- ▶ Check EBD files

Build IBIS Template: Concept

- ▶ IBIS Template = IBIS file without table data

```
[Model]                INPUT_1600
Model_type             Input
|
Vinl = 575.000mV
Vinh = 925.000mV
|
|                      typ                      min                      max
C_comp                0.600pF                0.500pF                0.700pF
|
[Model Spec]
Vinl                  0.5750V                0.5375V                0.6125V
Vinh                  0.9250V                0.8875V                0.9625V
|
[Voltage Range]       1.5000V                1.4250V                1.5750V
[Temperature Range]   50.0                  110.0                  0.0
|
| *****
| (table data here)
| *****
[Model]                INPUT_1866
...
```

Build IBIS Template: Requirements

- ▶ Define base models
 - E.g. DQ, DQS, CLK
 - These can match the [Model Selector] names
- ▶ Distinguish between IBIS parameters that are
 - Standard – fixed for the interface specification
 - E.g. [Voltage Range], Vinl/Vinh, Vref/Cref/Rref, Overshoot
 - Variable – vary from device to device
 - E.g. C_comp, [Temperature Range]
- ▶ Script builds the template ensuring consistent results

Build IBIS Template: Input Examples

- ▶ Standard parameters
 - Read in as a predefined technology file
 - Tables of parameters for combinations of [Models] to be created
- ▶ Variable parameters
 - Input text file specified by the user
 - Directs the script to a subset of the technology file

Base_Model	DQ	DQ	DQ	DQ	DQ	DQ
Speed_Grade	800	1066	1333	1600	1866	2133
Vil_ac	-0.175	-0.175	-0.15	-0.15	-0.135	-0.135
Vih_ac	0.175	0.175	0.15	0.15	0.135	0.135
Vil_dc	-0.1	-0.1	-0.1	-0.1	-0.1	-0.1
Vih_dc	0.1	0.1	0.1	0.1	0.1	0.1
D_overshoot_ampl_h	0.4	0.4	0.4	0.4	0.4	0.4
D_overshoot_ampl_l	0.4	0.4	0.4	0.4	0.4	0.4
D_overshoot_area_h	0.25n	0.19n	0.15n	0.13n	0.11n	0.10n
D_overshoot_area_l	0.25n	0.19n	0.15n	0.13n	0.11n	0.10n

Speed_Grades	1066	1600	1866	2133
C_comp	typ	min	max	
DQ	1.200	1.125	1.275	
DQ_ODT20	1.078	0.966	1.223	
DQ_ODT30	1.118	1.019	1.240	
DQ_ODT40	1.134	1.044	1.238	
DQ_ODT60	1.161	1.074	1.259	
DQ_ODT120	1.174	1.097	1.255	

Build IBIS Template: Process Flow

Build IBIS Template: Details

- ▶ Build list of [Model]s
 - Loop over base models and features requiring separate [Model]s
 - Preserve the attributes of each [Model]
- ▶ Data structures created for each parameter
 - Data{Base_Model}{Speed_Grade}{Parameter_Name}
- ▶ Iterate for each [Model] to print the template section
 - Look up parameter values in the data structures
 - Subroutines to print each set of parameters to the template
 - Different cases of print routines for each Model_type

Import Table Data

- ▶ Read in the table data from IBIS files with a single [Model]
- ▶ Use a mapping file to assign each [Model] to its table data
- ▶ Script pastes the table data into the IBIS template

Table Data (dq_34.ibs)

```
[Model] DQ_34
...
[ Pulldown]
...
[ GND Clamp]
...
[ Pullup]
...
[ POWER Clamp]
...
[ Ramp]
...
[ Falling Waveform]
...
[ Rising Waveform]
...
```

Mapping File

```
DQ_34_1600 dq_34.ibs
DQ_34_1866 dq_34.ibs
...
```

IBIS Template

```
[Model] DQ_34_1600
Model_type I/O
...
| *****
| (table data here)
| *****
[Model] DQ_34_1866
Model_type I/O
...
| *****
| (table data here)
| *****
```

Format Package RLC Data

- ▶ Create [Package] and [Pin] list RLC data from a spreadsheet
 - Align columns and calculate typ/min/max [Package] values
- ▶ Calculate Z_0 and time delay then check for outliers

[Pin]	signal_name	model_name	R_pin	L_pin	C_pin
B3	DQ0	DQ	0.307	1.337E-09	3.680E-13
C2	DQ2	DQ	0.404	1.710E-09	4.585E-13
C7	DQ1	DQ	0.288	1.258E-09	3.676E-13
C8	DQ3	DQ	0.406	1.598E-09	4.789E-13

Signal	Z ₀	Time Delay
DQ0	60.28	2.218E-11
DQ2	61.07	2.800E-11
DQ1	58.51	2.151E-11
DQ3	57.76	2.766E-11

[Package]					
	typ	min	max		
R_pkg	307m	208m	421m		
L_pkg	1.64nH	1.059nH	2.514nH		
C_pkg	0.35pF	0.261pF	0.479pF		
[Pin]	signal_name	model_name	R_pin	L_pin	C_pin
B3	DQ0	DQ	307m	1.337nH	0.368pF
C2	DQ2	DQ	404m	1.710nH	0.459pF
C7	DQ1	DQ	288m	1.258nH	0.368pF
C8	DQ3	DQ	406m	1.598nH	0.479pF

IBIS Parameter Check

- ▶ Script to search the IBIS file for a parameter
 - E.g. `C_comp`, `Vinl/Vinh`, `Vref/Cref/Rref`, `Overshoot`, etc.
- ▶ Creates a report detailing the parameter's values in each [Model]
- ▶ Results can be filtered by [Model] names

DQ_34_1066	C_comp	1.200pF	1.125pF	1.275pF
DQ_34_ODT20_1066	C_comp	1.078pF	0.966pF	1.223pF
DQ_34_ODT30_1066	C_comp	1.118pF	1.019pF	1.240pF
DQ_34_ODT40_1066	C_comp	1.134pF	1.044pF	1.238pF
DQ_34_ODT60_1066	C_comp	1.161pF	1.074pF	1.259pF
DQ_34_ODT120_1066	C_comp	1.174pF	1.097pF	1.255pF

Build EBD Model

- ▶ Generate EBD model from spreadsheet data
 - Useful for fixed topologies such as stacked die packages
 - Input RLC & Len values and Pin & Node connections

Pin	Signal	Sub R	Sub L	Sub C	Ref.Pin	Ref.Pin
J2	CS0#	0.086	1.067E-09	5.879E-13	U1.119	
J3	BA0	0.110	1.533E-09	7.118E-13	U1.117	U2.117

Substrate RLC →

Wire Bond RLC →

```

[Path Description] CS0#
Pin J2
  Len=1 R=0.086 L=1.067e-09 C=5.879e-13 /
Fork
  Len=0 R=0.054 L=2.944e-10 C=4.220e-14 /
  Node U1.119
Endfork
|
[Path Description] BA0
Pin J3
  Len=1 R=0.110 L=1.533e-09 C=7.118e-13 /
Fork
  Len=0 R=0.054 L=2.950e-10 C=4.230e-14 /
  Node U1.117
Endfork
Fork
  Len=0 R=0.060 L=3.254e-10 C=4.666e-14 /
  Node U2.117
Endfork
    
```

EBD Connectivity Report

- ▶ Report showing EBD Pin to Node
 - Script prints out an entry for each Pin to Node connection
- ▶ Helpful for checking:
 - EBD Path names and IBIS Signals match
 - Correct number of node connections exist on each Path

EBD			IBIS			
Path Name	Pin	Node	File Name	Component	Signal	Model
DQ31	B5	U0.6	g69a_bd.ibs	MT42L64M32D1G69A	DQ31	DQ
DQ31	B5	U1.6	g69a_bd.ibs	MT42L64M32D1G69A	DQ31	DQ
DQ29	B6	U0.9	g69a_bd.ibs	MT42L64M32D1G69A	DQ29	DQ
DQ29	B6	U1.9	g69a_bd.ibs	MT42L64M32D1G69A	DQ29	DQ
DQ26	B7	U0.13	g69a_bd.ibs	MT42L64M32D1G69A	DQ26	DQ
DQ26	B7	U1.13	g69a_bd.ibs	MT42L64M32D1G69A	DQ26	DQ
DQ25	C9	U0.15	g69a_bd.ibs	MT42L64M32D1G69A	DQ25	DQ
DQ25	C9	U1.15	g69a_bd.ibs	MT42L64M32D1G69A	DQ25	DQ
DQ30	D7	U0.7	g69a_bd.ibs	MT42L64M32D1G69A	DQ30	DQ
DQ30	D7	U1.7	g69a_bd.ibs	MT42L64M32D1G69A	DQ30	DQ

Conclusions

► Cons

- Must invest time to write and validate scripts
- Risk of propagating errors
- Possibility of incorrect usage by inexperienced users

► Pros

- Improved model consistency and quality
- Efficient checks on large models
- Save time creating and validating models

Focused on Memory | Engineered for Innovation
